CInP® Glossary

Glossary from the GInI Applied Innovation Master Book, tailored to CInP

Prepared by GELLIFY Middle East

Sourced from AIInMB Book 6 (Glossary) - filtered for CInP relevance

May 2026

How to Use This Glossary

This is a CInP-scoped subset of the master GInI Applied Innovation Master Book (AInMB) glossary. Only terms relevant to the CInP exam are included; advanced enterprise-, M&A-, and strategy-specific terminology has been excluded.

Definitions preserve GInI's official phrasing wherever possible. When you encounter a term in the CInP Course Workbook or Question Book that you don't immediately recognize, look it up here first.

Capitalized terms (e.g., Front End of Innovation, Oblique Examination, Innovation Pipeline) are GInI nomenclature - pay particular attention to these, as the exam tests them by name.

#

10X Solutions - New solutions that are in some capacity ten times better than previous or existing solutions. By mandating a 10X solution, as opposed to simply a 10% better solution, a business will inherently force itself to pursue a breakthrough innovation rather than an incremental innovation. Being able to deliver a 10X solution requires a business to carefully reframe the problem they are addressing so as to ensure they are addressing it at the correct, most fundamental, level, and that they are addressing it in innovative new ways that readily resonate with those whose encountering the problem being solving. A

A

A Problem Worth Solving - A problem being encountered (or expected to be encountered) by some subset of customers in a market that is of adequate scope (enough customers are impacted) that a sound solution to the problem holds a high likelihood of realizing large scale in the market and thereby producing an attractive financial return to the business delivering it.

A VUCA World - The idea that the world businesses must now operate in is in fact a volatile, uncertain, complex, and ambiguous world.

Adjacent Market - A market who's needs are unique from, but in some ways similar to, another market. Though each such market has its own unique needs and requirements, usually arising from a unique set of problems it is trying to solve, it is often the case that a particular value proposition or offering – with its given attributes and capabilities – is well suited for use and application in each market, though in each case these are often used in different ways (representing different use cases). There is therefore enough overlap between each market's unique needs and requirements that a single value proposition is capable of addressing each unique set of needs and requirements.

Advocacy - The practice of advocating for a particular innovation project. Since some projects will be perceived as inherently threatening or risky to certain areas of the business, it becomes the job of the CInO and other innovation leaders to advocate for these efforts and to champion their cause, even when this sometimes means going to higher levels of authority in the business to get the support needed.

Agile - Characteristically quick, nimble, and responsive. Businesses can operate in an agile manner when sized and structured appropriately.

Agile Innovation - The use of innovation to empower a business to respond quickly and nimbly to evolving market changes so that it can continually remain relevant to each generation of the market. It can include a number of practices aimed at rapid market acuity and rapid executional turn-around of new innovations, often with a short, episodic approach to product development and introduction.

Agility - The skill of being able to operate with quickness, nimbleness, and responsiveness. For a business, this skill typically dictates a minimum of bureaucratic management control and a more empowered approach to governance that relies on individual and team executional skills and a shared set of values and principles around an aspirational mission and vision.

Ambidexterity - The ability to use one's left side and right side with equal dexterity. For a business organization, it infers the ability to operate very different areas of the business simultaneously with equal focus and attention given to each one.

Ambidextrous Organization - An organization capable of operating both types of core business function simultaneously – one side focusing on Operational Excellence – to maximize the value extracted from current Foundations of Value; the other side focusing on Strategic Innovation – to build the new Foundations of Value the business needs to ensure it will have a “tomorrow” to execute. In this paradigm, a balance is struck in which the business monetizes its existing operations to, in part, fund the development of its next operations, a cycle that repeats itself without end.

Anchor Points - The six (6) fundamental questions that every Business Model must address – Who, What, Where, How, When, and Why. Properly answering these six questions will “anchor” the Business Model into solving the right problem at the right and in the most effective manner possible.

Associating - The skill of being able to pull together the many disparate insights relating to a situation – individual customers, whole markets, business stakeholders, or others – and synthesize entirely new innovation solutions for that situation. It relies on Associative Thinking – creating new associations between otherwise unrelated things – otherwise known as “connecting the dots”. It is one of the five Innovation Discovery Skills documented in the book *The Innovator’s DNA* by Dyer, Gregersen, and Christensen.

B

B Discovery / Business Discovery - Focused discovery research work aimed at developing a fresh and renewed understanding of the internal state of a business. Its purpose is to help build a new context for a particular situation. To the extent possible, each individual who is to be a party to an Oblique Examination exercise should undertake their own Business Discovery work. This is so that they understand the insights it yields firsthand, and do not have to take them from secondhand sources. This makes the insights much more tangible and believable for the individual, which results in a far richer team exercise when the team moves into Oblique Examination.

Back End of Innovation (BEI) - In the conduct of innovation projects, that work which takes place at the back end of a project, after kicking off the endeavor as a formal project. This work typically involves everything required to fully define, design, develop, validate, and ultimately commercialize a new innovation solution. As there are often many stakeholders involved, together with an extensive amount of ecosystem activity that has to take place, this process may involve a pilot stage to prove out the viability of the solution in the market prior to making the full commitment and investment required to broadly commercialize or implement it. The Back End of Innovation is colloquially known as Innovation’s last mile.

Back-Enders - Those innovation workers whose work focuses primarily on the Back End of Innovation in projects.

Behavioral Prototype - A prototype used to test the behaviors of customers, typically in the context of how they interact with a particular design. Researchers use these in their Hypothesis Formation work to study, learn, and understand customer behaviors and the reasons behind them, as well as in their Hypothesis Testing work to test customer behaviors against certain hypotheses.

BOOM - A Moment of Truth that creates a particularly negative emotional response with customers. These typically result from failing to meet customers’ expectations at Touchpoints they consider to be particularly important, and where, therefore, their expectations are high.

Bottom-Up Innovation - An approach to Innovation Strategy – also known as Participatory Innovation – in which new innovation efforts are derived directly from opportunities identified bottom-up by the business’ workforce. This contrasts with Top-Down Innovation.

Brain Dominance - The concept that human brains are each wired differently, making each individual unique in their balance of thinking processes. According to leading brain dominance models such as the Hermann Brain Dominance model, the brain's thinking processes can be classified into four quadrants, starting with the Cerebral dispositions on the left and the Limbic dispositions on the right. The Cerebral dispositions are divided into the Rational Self and the Safekeeping Self, while the Limbic dispositions are divided into the Experimental Self and the Feeling Self.

Brainstorming / Structured Ideation - A generative group thinking exercise in which a team, working together, strives to conceive as many useful new ideas and solution concepts as they can to a particular challenge put before them. Used properly, the brainstorming process employs numerous individual and group methods to spark imaginative and creative thinking, including brainwriting, open ideation, storyboarding, piggybacking, and quick-and-dirty prototyping. Brainstorming has come to be a cornerstone collective-thinking tool in most all innovation work.

Brainwriting - An individual thought exercise in which individuals – often while assembled in a brainstorming group – spend time writing down their own creative ideas and thoughts about a particular challenge put before them. The exercise is done in silence. The exercise is often conducted in such a manner that individuals capture two or three thoughts on a poster, swap posters within a smaller group, and then build upon (piggyback) someone else's ideas in that group.

Breakthrough Innovation - An innovation involving a completely new offering, or new way of offering – inside of an existing category – that substantially raises the bar on the value and/or experiences being delivered. These often result from major changes in technology platforms and/or new configurations that extend an offering into new market applications.

Breakthrough Innovation Method - A proprietary innovation method associated with the Global Innovation Institute. It uses an ordered sequence of steps in which a team first conducts relevant research to establish a contextual foundation for the subsequent work. It then has the team to use a process known as Oblique Examination to critically and analytically examine a particular situation in search of new approaches to the situation. It ends with the team ideating numerous new concepts for addressing the situation and then incubating these with additional research and analysis so that one or more can be selected for implementation.

Bricoleur - A word coined by French social anthropologist Claude Lévi-Strauss referring to those individuals who characteristically demonstrate the pioneer spirit – that of the maverick, the explorer, and the entrepreneur... those who have an innate hunger for pursuing the “new” and in many cases for being the first do something of a particular significance. It has been noted that these types of individuals are often well disposed to pursuing innovation efforts inside of businesses, though they are not always fond of the rules, structures, and other mechanisms of bureaucracy that businesses tend to use. Instead, being of this nature, they inherently gravitate toward the freedom and autonomy that the exploration and experimentation of their work require, meaning they generally must be led in ways that fit with that disposition.

Business Experimentation / Business Experiment - A form of experimentation used to properly and correctly understand problems and their true nature. In this case, it would be a problem that is of interest to the business – typically because solving for it represents an opportunity to deliver new innovation. The process begins with a well-conceived set of hypotheses about the problem – as many as the business wishes to entertain.

Business Model - The means by which a business creates and delivers value into a market in order to produce a profit for the business. It is comprised of the business' Value Proposition and its Value Delivery model. The former addresses what, and to whom, the business will sell (these must be in

resonance with one another). The latter addresses how the business will create what it sells and where it will seek to sell it (these can have logistical bearings on one another). All businesses must employ an effective business model if they are to thrive and grow over time.

Business Model Canvas - A straightforward working tool that allows a business to contemplate the various attributes of a Business Model and by so doing experiment with different approaches to the six Domains and different combinations of the PoDs in order to compare various options. By creating, evaluating, and comparing numerous different options, the business should be able to strike upon the one best option which offers it the highest level of confidence for achieving a particular result or outcome. Like other such efforts, this can be a highly iterative undertaking.

Business Model Innovation - Innovation delivered in the form of a new Business Model that is measurably better than that currently used in a particular market. It can innovate around what is being offered, how it is being offered, to whom it is being offered, and where it is being offered. The most impactful Business Models, however, will innovate in at least two, if not more, of these complimentary areas, so as to produce a critical type of synergy.

Business Plan (Business Case) - A document of moderate detail explaining the nature of a new innovation and the plan for its development and implementation. It is used to help make the case for a business investing in its pursuit. It is typically constructed in a manner that tells a story about the innovation – one that builds upon itself.

C

Capability - Any ability a business can gain access to and thereafter leverage for the delivery of new innovations in its markets.

Category Innovation - The definition and creation of an entirely new product or service category. This is usually done by combining existing components into a new offering which offers a new form of value that did not previously exist on the market. In most cases, Category Innovation gives rise to entirely new markets.

Certified Innovation Professional® (CInP®) - A professional certification awarded by the Global Innovation Institute providing evidence of an individual's knowledge of the Innovation Professional role, including how to structure and run innovation projects, and how to operate and manage the business' Innovation Management system.

Challenge - The Surface Symptoms presented to a team when first confronted with a particular problem situation in a market. These are often various performance metrics and perhaps qualitative markers. They offer some evidence of the problem, but do not by themselves tell a team what the real problem is, or what is driving the problem, in terms of how existing solutions are failing to meet this market's needs.

Commercialization - The process associated with placing a new innovation into the market, making it open to market consumption. It involves a business establishing and activating the necessary channels for production, delivery, marketing, sales, and service of the innovation. So doing requires extensive planning and preparation work, including appropriate training of many different roles, and often large investments of capital.

Community of Passion - A Mechanism of Engagement in which a community of similarly impassioned individuals is formed around a particular area of passionate concern (often a market or world situation) so that over time they might learn from one another and conceive innovative new ideas for the business to pursue.

Community of Practice - A Mechanism of Engagement in which a community of like-minded individuals is formed around some particular area of interest (typically a functional area) so that over time they might learn from one another and conceive innovative new ideas for the business to pursue.

Compelling Pitch - A pitch presentation that decision-makers and investors find compelling, on account of the engaging and persuasive story it tells, and the in-depth research and Due Diligence it reveals. These decision-makers and investors are thus moved and compelled to take action – specifically the action of sponsoring and funding that which has been pitched.

Competitive Assessment - A detailed assessment of both established and emergent competitors in a particular market, including each competitors' characteristic strategy, business models, and strengths and weaknesses relative to one another and relative to the current and emerging state of the market.

Concept Prototyping - The physical construction of prototypes for various (potentially competing) design concepts. It is done so that each concept can be evaluated and assessed in a tangible and direct manner, and also so that different concepts can be subjected to comparative usability and/or performance tests.

Conceptual Prototype - A prototype – typically a 2D diagram or schematic – which illustrates the conceptualization of something, perhaps a large system or other similar artifact. They are often used to develop a shared understanding of a concept and its conceptual model, including potentially an analysis of its current state and the synthesis of a new state.

Constraint - A point encountered by customers in the course of trying to achieve some outcome – typically via a product or service and the jobs these afford – that hamper the achievement of the outcome, or its achievement in the way they desire or expect. This may either manifest in the need for the customer to invest extra time, effort, and/or expense to fully achieve the outcome, or in the inability to achieve the outcome in full, resulting in only partial fulfillment of the desired outcome. Both manifestations take away from achieving the desired outcome in the desired or expected manner.

Context - In applying the GInI Breakthrough Innovation Method, a statement of the business' objectives for engaging in the specific endeavor they are embarking upon. For teams, this provides a sense of direction and allows them to understand what it is they are seeking to accomplish. It gives them a clear point of focus at the center of the effort and establishes appropriate boundaries around its perimeter, enabling the team to channel their thoughts toward solving the correct business challenge.

Convergence - Decreasing in quantity, volume, and/or degrees of separation. In Design Thinking's Problem Clarity, this happens when a shrinking number of hypotheses remain as a result of eliminating hypotheses through business experimentation. In Design Thinking's Value Definition, this happens when a shrinking number of solution concepts remain as a result of eliminating concepts through prototype testing. Both situations ultimately culminate in a single candidate remaining.

Conversion - The act of converting an innovation idea in a business' Innovation Funnel into a funded innovation project in its Pipeline.

Copyright - A form of Intellectual Property protecting original content (recorded materials) such as manuscripts, books, articles, musical compositions, music recordings, films, and other such content. They are used to prevent unlawful copying and distribution of the content so that the creators of the content can enforce their right to compensation for its usage.

Core Innovation Group - A dedicated functional group within a business whose charter is to explicitly pursue innovation work and to execute innovation projects. Given that other groups in the business will typically be focused on executing the Horizon 1 elements of the business' Innovation Strategy (sustaining innovation work), much of this group's work will fall to carrying out the Horizon 2 and 3 elements of the Innovation Strategy – efforts typically focused on breakthrough, disruptive, and transformative innovations.

Core Innovation Team - An individual team within the Core Innovation Group. Such teams are often focused on carrying out specific Horizon 2 and Horizon 3 innovation projects. The members of these teams must possess certain discovery and execution skills, and ideally these teams are well-balanced with respect to those skills amongst the members.

Core Story - The second main section of a Winning Business Plan. It is comprised of five (5) elements – The Backstory, The Tension, The Size, The Solution, and The Relief. Together these five elements tell the heart of the story, setting the context for everything else that follows.

Corporate Antibodies - Forces at work within a business seeking to derail new innovation projects and cause them to fail. These forces arise out of entrenched business groups feeling threatened by the new innovation. They often fear (sometimes rightfully so) that the new innovation will cannibalize those Foundations of Value within the business they are tasked with protecting, promoting, and otherwise sustaining and growing (which may in fact be the case).

Creativity - The ability to apply one's mental capacities to the conception of entirely new solutions to defined needs or challenges. A necessary ability for successful group ideation and brainstorming. A useful ability for renewing businesses through evolution of their existing business models and offerings.

Crowdsourcing - A form of Open Innovation in which a business openly sources the identification of Ideas and Innovation Opportunities from a broad array of individuals and/or businesses who would not ordinarily be a party to the effort. These parties can be internal to the business, external to the business, or both. Businesses generally run these campaigns in search of one of two things – either new market opportunities to pursue (given the markets they are in and their particular strengths), or innovative new solutions to known problems in their markets (which can come from a potential partner's proprietary technologies).

Culture - The shared set of principles, values, beliefs, and characteristic behaviors a business demonstrates in the course of conducting its affairs. It involves both inwardly-focused and outwardly-focused behaviors. Culture is most often set through the examples exhibited by the business' leaders, as the rest of the organization will tend to mirror whatever principles, values, beliefs, and behaviors those leaders tangibly demonstrate, regardless of what may be said about them otherwise.

Culture of Innovation - A business culture that has embraced the cause and pursuit of new innovation, making innovation a core pillar of its strategic efforts. Such cultures produce environments that are welcoming of learning, exploration, and experimentation for the sake of finding new innovation opportunities to pursue. They also embrace the need for, and incorporation of, Innovation Strategies and Enterprise Innovation Programs so as to make innovation focused and sustainable within the business.

Customer Experience (CX) - Within a situation involving interactions between a business and a potential customer of that business, the events that take place and the customer's perceptions of those events. These perceptions will be colored by how well the events conform to (or exceed) the expectations the customer held for them prior to engaging with the business. Because these events involve direct interaction between the business and the customer (Touchpoints), these

interactions can be explicitly designed and staged to meet or exceed customers' expectations of them, and therefore to also create a distinguishably different situation or outcome that customers will value highly.

Customer Experience Innovation (CX Innovation) - Innovation delivered in the form of a compelling new customer experience. Such experiences have been explicitly designed to be new and novel in some important way and are explicitly staged to deliver a measurably better experience than what a given market previously had access to. It can include customer experiences staged manually by humans, automated and staged by machines, or – quite often – a hybrid of both working together. As an innovation, it is distinguishably different from, and better than, all other customer experiences seeking to produce the same effect or outcome.

Customer Experience Journey Map (CXJM) - A tool used for the analysis of existing customer experiences and the design of new customer experiences. It consists of three primary sections. In the first section the business captures preliminary considerations including the Customer Persona, the Experience Trigger, and the Brand Experience Lens.

Customer Experience Journey Mapping - The act of creating a Customer Experience Journey Map. This is usually done in an intense workshop setting in which all of the experience's stakeholders are brought together to either analyze an existing customer experience or collaboratively create a new customer experience.

Customer Pain / Friction / Obstacle / Roadblock / Constraint - Any of several points encountered by customers in the course of trying to achieve some outcome – typically via a product or service and the jobs that those products and services afford – that hamper the achievement of the outcome, or its achievement in the way they desire or expect. These points may either manifest in the need for the customer to invest extra time, effort, and/or expense to fully achieve the outcome, or in the inability to achieve the outcome in full, resulting in only partial fulfillment of the desired outcome. Both manifestations take away from achieving the desired outcome in the desired or expected manner.

Customer Profile - Collective, the eighth and ninth elements in a Winning Business Plan. They profile the customer being targeted for the proposed solution from both a demographic and psychographic standpoint. D

D

Decision Prototype - A prototype used to help a team make a specific decision it needs to make in order to move its work forward. See also Build to Decide.

Degree of Novelty - The scope with which an innovation is new. Any given offering generally has one of four levels of novelty: not new (pre-existing and in pervasive use around the world); new to the business (pre-existing elsewhere such as competitors and other markets, but new to a particular business); new to the market (pre-existing in other markets, but new to a particular market or markets); or new to the world (completely new to the entire world; no manifestation of it existed previously anywhere). Businesses must give consideration to this when contemplating the development and introduction of a new innovation, as it will inform them regarding how much work may be involved in selling it and what sort of return they can expect from it.

Demographics - The eighth element in a Winning Business Plan. It profiles the targeted customer from a demographic standpoint – items like age, race, gender, occupation, marital status, place of residence, and so forth. Only those aspects of the customer's demographics that are pertinent to the Tension and Relief should be included. If none are pertinent, this element should be omitted.

Design - The organized arranging of artifacts in a way that accomplishes a particular end goal. It is often conducted in a highly thoughtful manner that addresses the most fundamental needs or objectives that can be addressed through the effort.

Design Innovation - Innovation delivered in the form of compelling new design. This most often manifests in the form of appealing new and novel product design, but can also manifest as new and novel design in other domains, such as services and business models.

Design Methods - A collection of well-defined methods used to research, study, and understand both the problem space and the solution space for a given situation. They allow the Innovator to explore more deeply users and their underlying needs and motivations, as well as explore more deeply the fit between a potential solution and a specific need or opportunity. Design Methods are divided into four (4) categories based on the type of insights they produce.

Design Patent - A form of Intellectual Property protecting the physical form and/or graphical appearance of a business artifact. Such artifacts are claimed to be uniquely associated with a certain brand or offering and as such can be used to uniquely identify that brand or offering.

Design Research - Research into the design of an artifact – the features of a product, the layout of a web page, the flow of a mobile app, the touchpoints of a customer experience, and so forth. Its aim is generally to understand the nuances of the interactions between the artifact and its users (sometimes referred to as human-machine interfaces, or HMI). Its usual goal is to optimize those interactions in such a way as to maximize the value that users can derive from the artifact, in keeping with those users' desired outcomes and the intended Brand Experience the provider hopes to deliver.

Design Sprint - A Mechanism of Engagement (pioneered by Google) in which an Innovation Team is cloistered together for five days of intense work around a particular problem or challenge. On Day 1, they map out the problem and pick a place to focus their efforts. On Day 2, they sketch out competing solutions.

Design Thinking - An approach to innovation in which one is asked to “think like a Designer”, which infers to think in such a way that they are constantly in search of new patterns to emerge, so that they can devise new ways of arranging a solution to match a certain pattern. When applied to the search for new innovation, it means one is constantly challenging the assumptions behind a problem in order to search for deeper and more absolute truths about the problem – truths that can ultimately lead to better solutions. In tackling a specific problem, therefore, one must fully examine the situation they have been presented with, and then think about it in a way that peels back its layers so as to get down to the fundamentally human needs, desires, and motivations involved, which then can be used to design a solution that addresses the real needs at hand, and not just the surface needs they were originally presented with.

Design Thinking Process - An ordered series of steps aimed at properly understanding a situation and then conceiving an optimal solution for that situation. The process follows a conceptual model known commonly as the Double-Diamond model (first put forth by the British Design Council). There are two primary stages in this model – Problem Clarity and Value Definition.

Diffusion of Innovations - A concept explaining the manner in which new innovations become diffused into markets as a result of the way they are adopted by the people who make up those markets. In this conceptualization, a given market – when exposed to a new innovation – will produce five categories of adopters (of the new innovation) and those five categories will consistently represent a certain portion of the overall population. Just as importantly, each category of adopter will demonstrate a characteristically unique set of attitudes and behaviors toward the new innovation.

Discovery - The act of exploring a situation with the aim of discovering new needs and/or new solutions that represent new Innovation Opportunities.

Discovery & Insights - The thirteenth element of an effective Enterprise Innovation Program. It defines what mechanisms and resources the business is investing in to help drive its Discovery and Insights-Mining process. Examples of these can include dedicated Discovery Teams undertaking focused research aimed at uncovering the unmet needs in a market, or Futuring Teams engaged in Trend-Watching, Trendscouting, and Trendcasting.

Discovery Process - The mechanisms, processes, and activities a business uses to search for and discover new innovation opportunities. They include the means and opportunities afforded to Innovation Teams to go into a situation and conduct the necessary Need-Finding work, including observational fieldwork like Business Ethnography and Contextual Inquiry and office work like secondary market research, quantitative primary market research, and focus groups. Businesses and business groups must leverage whatever mechanisms, processes, and activities are best suited to their unique discovery needs.

Discovery Skills / Innovation Discovery Skills - A series of five specific skills – uncovered and documented in the book *The Innovator's DNA* by Dyer, Gregersen, and Christensen – that can empower a business to uncover breakthrough new insights and ideas and ultimately deliver breakthrough innovations. The five skills are Observing, Questioning, Experimenting, Networking, and Associating.

Discovery-Driven Innovation (DDI) - An exploratory innovation methodology aimed at identifying new Innovation Opportunities arising out of both currently unmet needs and emerging, anticipated needs in a particular market. Given its exploratory nature, it requires an extensive amount of research into latent customer pains and tensions (Needfinding), as well as into the relevant trends impacting a market (Futuring Research). After undertaking such research, the business can work to cross-correlate these trends and needs so that it can envision and conceive new Foundations of Value that will best resonate with those needs at those points in time.

Disruptive Innovation - An innovation involving a completely new category of offering that displaces a previous category on account of a significant change in its value equation. These often result from redefining needs, and often involve entirely new business models that rethink how assets are deployed to accomplish a particular end goal. They can also arise out of breakthrough new product technologies and service methods being applied to define solutions that work substantially better than previous solutions had, rendering the previous way of approaching a problem obsolete. These tend to disrupt entire industries and often results in the demise of certain businesses while preceding the rise of others.

Distillation - The act of taking everything that has been learned about a particular design space and about competing design concepts from the potentially long series of research and concepting activities leading up to this point, and distilling it all down into a final Design Strategy that optimally delivers on its Design Principles and therefore optimally addresses the particular problem, need, or challenge at hand.

Divergence - Increasing in quantity, volume, and/or degrees of separation. In Design Thinking's Problem Clarity, this happens when an increasing number of hypotheses are put forth, any one of which may be radically different from the others. In Design Thinking's Value Definition, this happens when an increasing number of solution concepts are put forth, any one of which may be radically different from the others. Both situations can go on indefinitely, for as long as a team wishes.

E

Empathic Understanding - A mental comprehension of what a particular person or group senses and feels under specific circumstances. It is often achieved by having engaged in some activity that forces the individual to actively empathize for that person or group, perhaps by spending time living in that person's situation and scenario, whether simulated or real.

Empathize - Sensing and feeling what another senses and feels by mentally transposing one's self into that person's situation and/or scenario.

Empathy - The experience of sensing and feeling what another senses and feels.

Empathy Map - A tool that builds upon, and is complimentary to, Customer Personas, in which one synthesizes observations about the characteristic customer relating to areas of internal processing and of external influence. Its intent is to allow the business to develop a deeper understanding of the customer's needs and motivations. The primary map has an upper section and a lower section.

Empathy Tools - Specially-made devices that enable individuals to put themselves into another person's physical state of being. Examples could include clouded glasses to emulate a visual impairment, thick gloves to emulate a tactile impairment, or a "fat suit" to emulate the constraints of obesity. Researchers use these tools in their empathy work, where they are engaged in developing a comprehensive sense of empathy for a particular set of users.

Engage - The act of participating in the Enterprise Innovation Program of one's business.

Engagement - The active support and involvement of a business' workers, teams, departments, groups, business units, divisions, and so forth in helping to identify new innovation opportunities and solutions, and in helping to partially or fully execute the innovation projects resulting from these. Engagement is a necessary ingredient for Participatory Innovation. See also Participatory Innovation.

Engagement Team - A dedicated team, comprised of Innovation Program Leaders, charged with leading specific Mechanisms of Engagement in the business intended to drive engagement of workers in the Enterprise Innovation Program. Leveraging a portfolio of mechanisms, this team will devise and execute a plan designed to engage as wide a variety of individuals and groups in the program as possible. They will evolve this plan over time in order to grow and sustain the overall level of engagement. This team is typically tasked with achieving certain KPIs with respect to organization-wide engagement in the program. Engine of Innovation – See Innovation Engine

Enterprise Innovation - The role within the business organization charged with operating a formal program of enterprise innovation, including engagement, Innovation Management (capture, evaluation, and selection), and project execution. The lens through which this profession sees the world of innovation is therefore one of how the business might drive both a top-down and bottom-up agenda of short, medium, and long-term innovation efforts in a sustained fashion across the business.

Enterprise Innovation Program - A formal program instituted within a business whose objective is to ensure ongoing sustained Innovation Output broadly across the business. To be effective and successful, it must be executed systematically while addressing six fundamental areas – Foundation, Procedures, Financing, Enablers, Engagement, and Reinforcers.

Entrepreneur - An individual who, acting either alone or in concert with other such individuals, endeavors to launch a new business enterprise. The lens through which these individuals view the world is an ambitious and often audacious one. It is one of how to create something completely

new and compelling – something that will potentially “unbundle”, or disrupt, an existing industry, as well as allow them to make history and possibly change the world in the process.

Entrepreneurialism - The propensity for launching new business ventures. It is often fueled out of a drive to create “the new” and sometimes to change the world and/or make history.

Evaluation & Selection - The act of evaluating and selecting new innovation ideas and opportunities in the business’ Innovation Funnel.

Evaluation & Selection Team – First Level - A dedicated team, comprised of Innovation Program Leaders, charged with conducting the initial collection and evaluation of new innovation ideas and opportunities coming in to the business’ Innovation Funnel (via its Dragnet), and thereafter selecting those concepts which they feel warrant further consideration by the Second Level Evaluation & Selection Team. In the course of evaluating these concepts, they may consult at length with the individuals and/or teams who conceived and submitted them so as to fully understand their intent and breadth. They may also combine several like concepts together into a single, more comprehensive, concept better suited for execution as a project.

Evaluation & Selection Team – Second Level - A dedicated team, comprised of higher-level executives in the business (Directors, Vice Presidents, and so forth), charged with conducting the final evaluation and selection of new innovation ideas and opportunities for the business to pursue. The concepts presented to this team will have previously been vetted by the First Level Evaluation & Selection Team, and accordingly narrowed down from an initial pool of submissions. Concepts this team selects will be converted into real innovation projects (a process known as Conversion), though the first phase of such projects will generally be to undertake additional research and analysis so as to build a fully detailed business cases, complete with detailed financial assessments, after which certain of the projects will be rejected or redirected.

Evaluation Process - The series of mechanisms, processes, and activates a business uses – within its Innovation Funnel – to evaluate new innovation ideas and opportunities. In many organizations, this is a dual-stage process, in which the first wave of evaluations is conducted by a Level 1 Team of Program Leaders and the second wave of evaluations is conducted by a Level 2 Team of executive leaders. In this case, the set of ideas and opportunities being evaluated by the Level 2 Team are those that were previously selected by the Level 1 Team out of the entire population of ideas and opportunities submitted.

Executive Ideation Workshop - A type of focused Innovation Workshop in which a business’ senior executives are engaged in examining and questioning all the fundamental assumptions underlying their business, carefully exploring the most pressing business and innovation challenges they are facing, carefully considering their markets’ expected future trajectories, and then, with all this underfoot, rethinking their core business in fundamentally different ways that both speak to their markets’ trajectories and their own biggest challenges. The aim is to come away with some fresh new ways of thinking about the business that may be able to move it toward, perhaps by weaving these ideas into what the business currently does, or perhaps by making major course corrections so as to change what the business does. These workshops can be moderate in nature – renewing the business, or extreme in nature – reinventing the business.

Experience - The events occurring within a given situation and the perceptions of those events by each individual or group who is a party to the situation. These perceptions are generally colored by how well the events conform to (or exceed) the expectations that each party held for them prior to engaging in the situation. Experiences are considered innovative when they: a) are distinguishably different from other experiences and b) produce a situation or outcome that is of high value to recipients.

Experience Design - The act of explicitly designing a new Customer or Business Experience so that it can be properly and consistently staged for its recipients. Key to this design are the detailed stakeholder actions (On-Stage Actors and Backstage Supporters) that must be properly executed each time for successful staging.

Experience Prototype - A prototype used to simulate a customer experience and/or the immersive environment in which that experience is intended to take place. The types of customer experiences involved are typically ones that will be intentionally designed and purposefully staged. Experience Prototypes are often used with a Design Method known as Bodystorming.

Experiment Methods - The third of four categories of Design Methods. These methods are designed to allow researchers to engage in experimentation with or around subjects so as to develop deeper insights into them and potentially test and eliminate certain hypotheses about them. With these methods, researchers conduct experiments to test out different concepts with customers in order to discover their cognitive and visceral reactions to them. This reveals further insights into their needs, desires, aspirations, motivations, and even values and beliefs.

Experimenting - The skill of being able to conceive and conduct critically probing experiments about a situation – individual customers, whole markets, business stakeholders, or others – and derive useful and relevant insights from the findings of those experiments. It is one of the five Innovation Discovery Skills documented in the book *The Innovator's DNA* by Dyer, Gregersen, and Christensen.

Exploration - The act of exploring a situation with the aim of discovering new needs and/or new solutions that represent opportunities to deliver new innovation.

F

Failure - An outcome substantially different from the one a business had intended, planned for, and acted toward ("success"), resulting in a net negative result for the business, usually in the form of revenue or profit not realized, customer dissatisfaction, noncompetitive offerings, and/or erosion of Brand Value. It is generally accepted that an occasional market failure is an indication that a business is pushing hard to expand the boundaries of its market with new innovations (in other words, a natural consequence of being innovative and moving fast). While this can be true, there can also be numerous other causes of failure, including a poor business strategy, a lack of market acuity, or an inability to execute what was planned.

Final Selection - The final, and ultimate, selection of a new innovation concept. It occurs when the concept has been selected by a Level 2 Evaluation & Selection Team (staffed by executive leaders in the business). Final Selection infers Conversion into a real innovation project in the business' Innovation Pipeline, and thus funding for at least the first phases of the Pipeline.

Foundation of Value - A manifestation of value that a business offers and sells into a market involving various value propositions that each resonate with some recognized set of needs or desires in that market. At a primary level, it involves the products, services, and explicitly designed and staged customer experiences a business monetizes in the market. These are designed to meet customers' functional needs. At a secondary level, it also involves the Brand Promise and Brand Identity associated with these offerings. Those are designed to meet customers' emotional and social needs.

Front End of Innovation (FEI) - In the conduct of innovation projects, that work which takes place at the front end of an endeavor, usually prior to kicking it off as a formal project. This work typically involves the upfront needfinding, exploration, and market and user research required to identify new innovation opportunities, as well as the brainstorming and ideation around potential new

solutions to address the unmet and/or unarticulated needs discovered in the market (which can be either current or emerging unmet needs). Because at this point an understanding of needs and the value propositions that will ultimately resonate with those needs are often still very fuzzy, this phase was originally referred to as The Fuzzy Front End of innovation endeavors.

Front-Enders - Those innovation workers whose work focuses primarily on the Front End of Innovation in projects.

Frontline Innovation Workshop - A type of focused Innovation Workshop in which frontline staff (professionals and managers from different business units and functional groups) are engaged in studying one or more particular situations in the business and thereafter ideating and trying out one or more potential solutions to the situation. Any one of several creativity and innovation methods may be used in these workshops, including Brainstorming, Lateral Thinking, and GInI's Breakthrough Innovation Method (BrIM). Frontline Innovation Workshops tend to be relatively discrete events.

Frugal Prototype (Quick & Dirty Prototype) - A prototype built quickly and easily using readily available materials. Though low in fidelity, these are quite capable of communicating ideas and concepts effectively. As such, they allow researchers to quickly assemble a number of variations of an idea or concept to share with others.

Functional Prototype ("Works Like" Prototype) - A prototype that, though its appearance may look nothing at all like the design intent, nevertheless presents an accurate rendering of the functionality of something. They allows researchers and designers to demonstrate, with relatively good resolution, the functionality of a design. They are often used for technical reviews and for verification testing.

Futuring - Any combination of forward-looking, speculative analyses, including Trend Watching, Trend Scouting, STEEPL Analysis, Trendcasting, Scenario Planning, and Stress Testing.

Futurist - An individual or group who engages in Futuring work on a professional level, including not only the speculative synthesis of potential future scenarios, but also the analysis of alternative business strategies and the recommendation of select strategies most likely to be robust against those scenarios. G

G

Gamification - The practice of gamifying a business' Ideation Challenges so as to make them more enticing, fun, and engaging to the organization. Examples of ways in which these have been gamified include participants vying for the most credits for the number of ideas they've submitted, vying for their peers' up-votes on their ideas (and avoidance of down-votes), and vying for ideation status by actively voting on other people's ideas. In many cases, augmenting Ideation Challenges with gamification drives greater engagement and participation in the challenge, producing more ideas and better ideas than they would likely receive otherwise.

Go-To-Market Strategy (GTM Strategy) - The set of strategies by which a new offering (solution) will be commercialized into a given market. It spells out the specific production and delivery channels that will be used (how the offering will be produced and delivered), the specific marketing channels that will be used (how the solution will connect with would-be customers in a way that resonates with their needs and motivations), and the specific sales channels that will be used (how the solution will actually be sold to end customers). Commercialization Strategies are constructed with the general aim of maximizing the solution's adoption amongst its target market or market segment.

H

Hackathon - A Mechanism of Engagement in which teams of participants – who may be internal or external to the business, or both – are immersed into an intensive session where they are tasked with creating a new offering concept in very little time. In most cases, they will work in teams of typically two to four members. Hackathons can focus on any type of technology, product, or service, though more often than not they are used to focus on software products.

Hand-off (Project Hand-off) - The event in which a Core Innovation Team hands off an innovation project to another party – typically an existing business unit (known as the Downstream Receiver) – so that the receiving party may assume downstream ownership of the project. This occurs so that the receiving party can carry out the final Back End execution work of implementing or commercializing the project – a practice that makes sense given that after the project’s launch this party will be the ones who will have to continue owning it. Hand-offs can be either discrete or prolonged events.

Happenings Intelligence - Insights into new ideas that people are promoting and/or new innovations that businesses are offering. Such insights can be obtained from any number of online resources (for example, Springwise and Insider) and live festivals (for example, TED and The Aspen Ideas Festival).

Horizon 1 (H1) - In the Three Time Horizons model, the first time horizon a business must address. This horizon is most commonly associated with the short-term time window. Its focus and objective is to “extend and defend the core business”, securing for the business the “right to grow”, and maximizing the financial return it can extract from its current Foundations of Value so that it can reinvest into its more forward-looking work for the next two horizons (2 and 3).

Horizon 2 (H2) - In the Three Time Horizons model, the second time horizon a business must address. This horizon is most commonly associated with the medium-term time window. Its focus and objective is to “expand the core by building emerging businesses”, securing for the business actual new avenues for growth, and maximizing the future prospects it can realize from its next Foundations of Value. It thus relies upon extensive experimentation around new and evolving market opportunities and the disciplined execution of Value Creation strategies aimed at capitalizing on those opportunities. See Three Time Horizons. See Horizon 1. See Horizon 3. See Foundations of Value. See Value Capture.

Horizon 3 (H3) - In the Three Time Horizons model, the third time horizon a business must address. This horizon is most commonly associated with the long-term time window. Its focus and objective is to “create viable new options to transform the organization”, identifying new areas of opportunity where, through appropriate transformation and reinvention, the business can conceive and deliver entirely new Foundations of Value that will create viable paths for the business well into the future.

Human Centric Design (HCD) - A philosophy of design practice that places the human – the user or recipient of a design – at the very center of the design process. It holds that a solution’s design must fundamentally abandon the Surface Symptoms of the situation it is addressing, and strive – using any means possible, but primarily using Design Methods, which are rooted deeply in human psychology – to come to a proper understanding of the human needs, desires, and motivations lying behind those symptoms. If the solutions’ design can do this, then it will succeed at resolving that situation in a substantially better manner than have prior solutions.

Hypothesis - A belief, or theory, about the reasons behind a particular problem, need, or challenge. It seeks to explain the underlying, fundamentally human, needs, desires, and motivations – and sometimes values and beliefs – that lead a certain group of people to experience

a particular situation in a particular way. If correct, it allows one to conceive a new solution to the problem that can effectively address those needs, desires, and motivations. Hypotheses are used in the Design Thinking processes to explore the possible reasons behind a problem and ultimately arrive at the correct reason.

Hypothesis Formation - The first step in the Problem Clarity stage of Design Thinking. It involves formulating an array of hypotheses about the real need associated with a particular problem or challenge. It is a divergent process which is usually informed by Observation and Questioning research. This is a divergent process.

Hypothesis Testing - A deductive exercise in which a team, working together, goes about testing the various hypotheses they had previously established through Hypothesis Formation. The manner in which these hypotheses are tested is known as Business Experimentation, and typically involves the team, in some manner, mocking up a representation of each hypothesis and then subjecting that mock up to representative testing with appropriate test subjects and scenarios. The aim of Hypothesis Testing is to allow the team, having duly tested each hypothesis it has previously formed, to isolate and converge on the single best hypothesis that most accurately captures the nature of the situation they are addressing.

i-Mentor / i-Coach - A Mechanism of Engagement in which Innovation Specialists – going by the title of either i-Mentor or i-Coach – engage directly with Innovation Teams for the purpose of helping them apply select innovation methods in highly focused ways so as to accelerate their development of both problem insights and solution insights. These individuals therefore help teams either find innovative ideas more quickly or find commensurately better innovation ideas for the business to pursue. See also Innovation Facilitator.

Idea - A concept representing a potential new innovation the business can deliver. They are generally in response to some identified unmet or under-met need in a market or in the business.

Idea Management Software - Purpose-built software designed specifically to allow a business to execute its Assimilation Process. Most platforms in this category allow managers to run challenges and contests among both internal and external participants (including gamification), accumulate and manage the incoming submissions, and aggregate like ideas as needed. Many platforms also go on to facilitate the Evaluation & Selection Process associated with the business' Innovation Funnel. And some even go further yet to help manage projects that have been initiated in the business' Innovation Pipeline, though in many cases that work gets handed over to Portfolio Management Software and other tools at this point.

Ideate - To engage in the conception of ideas.

Ideation - The act of conceiving new ideas, typically applied toward a particular challenge that has been put forth. It can be carried out on either the individual or group level.

Ideation Challenge - A Mechanism of Engagement in which participants – who may be internal to the business, external to the business, or both – are presented with a particular challenge to consider and come up with innovative new ideas for. The challenge can be to identify major new opportunities for the business to pursue, given the markets it is in and its particular strengths, or to identify innovative new solutions to a particular market need it has identified. These are sometimes (but not always) run as contests, with varying levels of gamification involved (such as participants voting up / voting down one another's ideas).

Imagination - The ability to conceive in one's mind any number of Ideal Future States for a particular situation, regardless of how connected they may or may not be to current realities. This allows one to question the "why" of the situation as it currently exists, and challenge that understanding by positing that it need not necessarily be that way, but might possibly be valid as something radically different, especially if circumstances and assumptions have changed since that current reality was set into motion. By so doing, it allows one to abandon the status quo of a situation and define entirely new conceptions of the situation.

Incentive - A consideration offered to a business' workers for simply engaging in its Enterprise Innovation Program, regardless of what becomes of their Inputs. The sole intention is to drive the level of upfront engagement in the program. In general, the more an individual contributes to the program, the more incentives they can claim.

Incremental Innovation - An innovation involving incremental improvements to an existing offering, whether in terms of performance, price, accessibility, or other key dimensions of value. These are noticeably new and novel in nature, but do not fundamentally change the offering. They often result from the incorporation of new technologies new features, and new capabilities, or changes that reduce costs and thus enable price reductions, and/or the use of new sales channels.

Incubation & Selection - The fifth step in the GInI Breakthrough Innovation Method. It is an exercise in which a team takes an extended period of time to undertake additional work on the value models selected in the preceding step. Their work can include any array of research, studies, and analyses, including, for example, market research, technology research, design studies, and financial analyses.

Industrial Design - The functional discipline charged with crafting the general form, function, and appearance of a product, including the materials, colors, and finishes of each of its distinct user-engageable parts and surfaces.

Initial Selection - The initial, or preliminary, selection of a new innovation concept. It occurs when the concept has been selected by a Level 1 Evaluation & Selection Team (staffed by Innovation Program Leaders). It then passes to a Level 2 Team.

Initiation (Project Initiation) - The act of initiating new innovation projects in the business' Innovation Pipeline.

Innovation - The act of doing something in a new or novel way that delivers more value and/or better experiences to those who receive and use it.

Innovation Camps - Private camps – often in remote locations and with rustic facilities – which businesses can leverage to stage specific innovation events like workshops, Design Sprints, and Hackathons. By removing their workers from their normal routine environments, these new environments are intended to help open up their minds to new forms of thought, thus producing the streams of consciousness they need to strike upon innovative new concepts they might not have conceived back in their own offices. Such camps are often staffed with Innovation Specialists who facilitate these events.

Innovation Challenge - A focused challenge that a business issues to its organization and/or outside partners, in which a specific need, problem, or opportunity is put forth, and participants are asked to come up with innovative new ideas on how to tackle that need, problem, or opportunity. Such challenges tend to be very effective at focusing participants' thinking around a particular problem, such that the business is able to generate a high volume of new ideas specifically targeted at addressing that need, problem, or opportunity. Because of this, they are also useful in allowing the business to find effective ways of executing its Innovation Strategy.

Innovation Competency - The skills and capabilities a business possesses for being able to pursue innovation broadly toward its defined business objectives. Businesses with high Innovation Maturity tend to have strong Competency.

Innovation Dragnet, The - The second stage in a proper Innovation Management System, focused on Capture. It involves the series of mechanisms, processes, and activities a business uses to generate and capture a broad array of new innovation ideas and opportunities. Such ideas and opportunities can be cultivated from inside the business, outside the business, or both, and within the business from the top down, the bottom up, or both.

Innovation Facilitator - An Innovation Specialist who engages with different project teams around the business for the purpose of helping them leverage and apply key Innovation Methods in their projects. They often function as floating internal consultants in the business. These individuals are trained, certified, and experienced in a number of different Innovation Methods, including Design Thinking and Human-Centric Design (which often serve as the foundation for this role), brainstorming, Lateral Thinking, Outcome-Driven Innovation, Customer Experience Design, and more.

Innovation Framework, The - The first stage in a proper Innovation Management System, focused on Strategy. It leverages and applies the business' Innovation Strategy to focus the organization on pursuing the right types of opportunities the business is looking for. As such, it establishes the framework within which all the rest of the organization's Innovation Management efforts will be conducted. This stage precedes the Innovation Dragnet.

Innovation Funnel, The - The third stage in a proper Innovation Management System, focused on Evaluation and Selection. It involves the series of mechanisms, processes, and activates a business uses to evaluate the ideas and opportunities captured in its Innovation Dragnet, and thereafter select those that are to be converted into real innovation projects. Ideas at this stage have been sorted, aggregated, and otherwise prepared for evaluation, and now may be the subject of various research, justification, and pitching activities.

Innovation Governance - The practices associated with governing a business' Enterprise Innovation Program. It includes how the business establishes and executes its Innovation Strategy, how it engages sponsors and leaders for the program, how it promulgates a culture and environment that is conducive to the program, how it structures the parts of the organization that must run the program, how it operates its Innovation Management System (IMS), how it ensures appropriate funding of the program and manages its innovation budgets, how it manages the various enablers needed for the program, how it drives ongoing engagement in the program, and how it manages the efforts needed to reinforce and grow the program.

Innovation Inspiration - A principle associated with the design of Innovation Spaces which holds that such spaces must be designed to inspire innovation within the business. This generally leads to the use of artifacts like art, historical keepsakes, natural lighting, spacious views, and architectural designs reflecting the identity of the business. These are often capable of reinforcing the business' identity, mission, and vision, and thus of inspiring innovators to think boldly about what the business is capable of doing, and thus should do.

Innovation Jam - A Mechanism of Engagement in which participants are invited into a running conversation about the world and about particular needs they see (especially emerging needs) in their affected markets that stand to be addressed by resourceful businesses. These conversations build upon one another and collaboratively spark all manner of fresh thinking about the challenges and similarly large volumes of new ideas about what can possibly be done about them. In large organizations, Innovation Jams can be run globally and can go on for months, with individuals investing significant amounts of time in the discussions.

Innovation Lab - A purpose-built space within a business designed and used specifically to accommodate innovation work. Most Innovation Labs are in fact actually a collection of smaller labs within the greater lab. Depending on the business and the nature of its innovation work, these smaller labs can be of any type, including, for example, administrative offices, meeting spaces, Pitch Rooms, Prototype Shops, User Research Labs, Observation Rooms, R&D Labs, Design offices, and so forth. All of these will generally be considered a part of the business' Innovation Lab, even if not always physically clustered together.

Innovation Management - The practices associated with managing a business' flow of innovation ideas and opportunities on the front end so as to convert a portion of those into real innovations that are delivered on the back end.

Innovation Management System (IM System / IMS) - The formal system a business has in place for managing its flow of ideas and opportunities so that it can convert some portion of those into real innovations it delivers in the marketplace. A good IM System starts with the business' Innovation Strategy so as to focus the organization's efforts toward the right types of opportunities (often via focused Innovation Challenges). They then have mechanisms for driving and capturing Inputs into the system – the Innovation Dragnet.

Innovation Manager - An Innovation Professional who has been placed into a position of leadership in the business' innovation program, either directly over its Enterprise Innovation Program and Innovation Management system (Program Leader) or over an individual innovation project the business is pursuing (Project Leader). Innovation Managers can hail from any discipline in the business, and must fully understand how the business' innovation program and IM system operate so that they can successfully leverage it to drive the Innovation Outputs that lead to the outcomes the business seeks. The Global Innovation Institute's Certified Innovation Professional® (CInP®) provides evidence of knowledge of this role.

Innovation Opportunity - An opportunity identified by a business to deliver an innovative new solution to a market. Such opportunities arise out of the identification by the business of either a particular unmet or ill-met need in that market, or an emerging need relating to certain trends impacting the market. Once the business has isolated the specific need, it can then conceive and test various solutions to the need in order to find an optimal solution.

Innovation Pipeline, The - The fourth stage in a proper Innovation Management System, focused on Project Initiation. It involves the series of mechanisms, processes, and activates a business uses to initiate new innovation projects into the Pipeline. This often includes assigning a Project Initiation Champion (who helps to get it through its first few months so as to get off the ground with a firm start) and an Innovation Team and Team Leader (whose first step will often be to more fully research, analyze, and pitch the opportunity).

Innovation Professional - A front-line professional (individual contributor) engaged in innovation work, whether through informal intrapreneuring or via a formal and fully-sanctioned innovation project. These individuals will hail from a large array of functional disciplines, including Strategy, Finance, Marketing, Design, Engineering, and more. The Global Innovation Institute's Certified Innovation Professional® (CInP®) provides evidence of knowledge of this role.

Innovation Program Leader - An Innovation Manager charged with helping to operate and manage the business' Enterprise Innovation Program, including driving its Innovation Management evaluation and selection processes, liaising with business unit counterparts, driving engagement in the program, driving Open Innovation relationships, facilitating workshops, and so forth.

Innovation Project Leader - An Innovation Manager charged with leading discrete innovation projects. In this role, they will typically also serve as the Team Leader, leading the team of

Innovation Professionals who are working with them on the innovation project. At times this role requires the individual to play the part of Project Champion – championing and evangelizing the project across the organization to ensure it gets the attention and support it requires to succeed.

Innovation Pull (Driving Pull for Innovation) - The “pull” for new innovation which occurs inside of an organization and its business units as a result of the business’ top leadership having issued a Mandate for Innovation, which would typically stipulate that some portion of each group’s efforts must relate to innovation and/or originate from within a Core Innovation Group.

Innovation Sandbox - The “working space” a business uses to experiment with new innovations. Small, young technology startups may use the open market as their sandbox, releasing a Minimal Viable Product to real customers and having them provide feedback, from which the startup would rapidly evolve the offering. For them, since they have no established brands to protect, the risk is low.

Innovation Space - Any of several possible spaces within a business that are dedicated solely to innovation work, whether that be the formal innovation work of a Core Innovation Group, or the informal innovation work of the rest of the organization as they seek to engage in the business’ innovation program – particularly the more intrapreneurial of these individuals and teams. Two types of Innovation Spaces are in common use – general innovation spaces for open collaboration and experimentation, and purpose-built Innovation Labs designed to facilitate specific types of work. Innovation Spaces, regardless of type, must be capable of doing three things – 1) facilitating the innovation-specific tasks that teams need to accomplish (research, design, experimenting, strategizing, and so forth); 2) fostering open collaboration, so as to hopefully spark new ideas through the random interactions of different individuals; and 3) inspiring innovation within the business, which can come from elements like art, historical artifacts, natural lighting, and impressive views of the outside world.

Innovation Strategist - A role within the business enterprise whose job is to help the business define its high-level Innovation Strategies and then in support of that lead focused efforts aimed at identifying key market opportunities for the business to pursue, focusing more narrowly on precisely where and how the business will deliver new innovation. They are particularly interested in helping the business find the opportunities for delivering breakthrough and disruptive Innovation it needs to periodically reinvent itself. The role also involves actively helping the business choose the most promising opportunities to pursue, as well as coaching workers on how to develop the business plans and pitch decks they will need to justify and defend their ideas.

Innovation Strategy - A comprehensive strategy laying out three things: 1) the business’ choices for the types of Strategic Innovation Pathways it desires to pursue (how it wishes to grow the business); 2) the business’ portfolio of specific innovation projects it is currently pursuing in support of Item 1; and 3) the business’ choices for the types of Strategic Innovation Vehicles it will leverage in the pursuit of Item 2. Thus at a high level, it prescribes where, in terms of markets, technologies, and offerings, the business intends to pursue new innovation for the short, medium, and long-term horizons in order to achieve its strategic objectives. And at a lower level, it prescribes the portfolio of actual innovation projects and initiatives the business is pursuing or intends to pursue, in support of the high-level strategy.

Innovation Tournament - A Mechanism of Engagement in which the business sponsors a formal prize-based, force-ranked competition, generally open to the public (in which case it is considered Crowdsourcing). Its objective is to generate as high a volume as possible of high-caliber ideas within a set timeframe... the “best new idea for x”. The prizes associated with these tournaments tend to be very large – often in the hundreds of thousands of dollars (much larger than the typical Ideation Challenge).

Innovation Workshop - A Mechanism of Engagement in which participants are led through various types of workshops (usually by expert facilitators) aimed at helping them to unpack a particular situation, challenge, need, or opportunity, and thereafter come up with innovative new solutions the business can pursue for these. Workshops range from being very direct and focused, intended to produce very discrete, intentional outcomes, to being very broad and open, intended only to help leaders broaden their horizons of thinking around the business (which later on can lead to innovative new lines of business they pursue).

Innovator's DNA - The possession of specific Innovation Discovery Skills – as uncovered and documented in the book *The Innovator's DNA* by Dyer, Gregersen, and Christensen – that lead to breakthrough insights and ideas and ultimately to innovative new businesses.

Input - The number of Inputs being submitted within a particular time period. Many organizations track their number (and caliber) of Inputs for each period and have KPIs for the level and pace of Inputs the business wishes to see. Since many ideas and opportunities will be culled inside the Innovation Funnel, the level of Input will always exceed the level of Conversion (a ratio greater than 1).

Inputs - The ideas and opportunities entering into a business' Innovation Funnel via its Dragnet. This includes both Top-down and Bottom-up ideas and opportunities. Top-Down Inputs generally arise through Strategy teams proposing specific opportunities. Bottom-up Inputs usually occur through Engagement.

Insight - Unique and potentially proprietary knowledge about a situation that is of useful value to a business. The knowledge is often actionable in the sense that it points the business to specific strategies and tactics that allow it to capitalize upon the situation.

Insights Mining - The act of digging up ("mining") information about a situation that allows the organization to develop new insights around it. The information may either come from generating it directly via first-hand observation and study, or by securing it from secondary sources.

Inspiration - Anything which moves or compels the members of a business to pursue a new innovation in resolution of a need they have identified. These often move businesses to deliver highly-impactful innovations, such as disruptive and transformative innovations.

Intellectual Property - Certain knowledge, content, and/or brands, and the representations of these, that come under the legal ownership of an assignee. Forms of Intellectual Property include design patents, utility patents, trademarks, copyrights, and trade secrets. With the exception of trade secrets, all are publicly documented and, if granted by an official IP office such as the United States Patent and Trademark Office (USPTO), become the legal property of the assignee for a designated period of time. Trade secrets remain undisclosed to the public and are protected only on the basis of the assignee themselves maintaining them as secrets.

Intellectual Property Protection - Legal protections afforded to the assignee of an Intellectual Property to enforce their sole ownership and use of the property and thereby prevent its usage by unauthorized parties.

Intellectual Property Rights - The specific legal rights afforded to the assignee of an Intellectual Property to enforce their sole ownership and use of the property and/or license its use to others in exchange for monetary or other considerations. The nature and extent of IP rights vary from nation to nation, depending on the specific legal codifications in place in each nation.

Intelligent Pursuit of Innovation - An approach to pursuing innovation in which specific steps are undertaken to maximize the final executed projects' chances of commercial success and thereby minimize the business' level of risk exposure from innovation. This approach requires being able to

do three things. First, to define the specific activities, mechanisms, and methods needed to quickly and cost-effectively (which often infers frugally) study a particular market situation and the opportunity it represents, so as to arrive at the insights needed to establish whether or not it represents a problem that is worth the business pursuing.

Internal Examination - The act of looking inward into a business in the search for new opportunities to innovate. In this case, the examiner may find previously untapped resources that can be applied in new ways to solve old problems, unleashing innovations the business had been overlooking.

Intrapreneur - An individual within an established business who demonstrates the entrepreneurial spirit to take hands-on responsibility for driving a new innovation through the business. They actively and assertively engage in a certain level of personal risk-taking, and sometimes in unsanctioned efforts, to bring these new innovations to life. Intrapreneurs are naturally predisposed to being entrepreneurial, and as such actively seek out the means within the business of using that disposition to pursue new things for the business in a fast, lean manner. As a result, Intrapreneurs often surface through the various Mechanisms of Engagement the business is using, particularly its Redline mechanisms.

Intrapreneuring - The act – within an established business, and at times outside of formal sanctioned activities – of taking the personal initiative, potentially at some risk, to drive a new innovation through the business.

Invention - The definition of a new concept that – generally through the arrangement of certain artifacts and the commensurate application of relevant laws of science (physics, economics, law, and so forth) – is capable of achieving an outcome not previously achievable, including achieving a certain outcome in ways that are more efficient, effective, practical, economical, or that deliver substantially greater value to its recipients than they previously had access to. This can end at just a concept and need not be put into actual use.

J

Jobs To Be Done / Jobs (JTBD) - The intermediate achievements a customer seeks to accomplish (using a product or service) in the pursuit of some final outcome. Some outcomes, and the products and services offered for achieving them, involve many such jobs, while others may involve only a few jobs. In general, customers will consider certain jobs more important than others, and likewise, certain jobs currently better served than others. Businesses can thus target new innovations toward those jobs that are simultaneously of high importance and least well served.

K

Key Performance Indicator (KPI) - A specific business outcome that can be measured and tracked and thereby compared against target levels set by the business. These are used in critical areas of the business to monitor actual business performance and compare to intended business performance. L

L

Lateral Thinking - A generative approach to creative thinking and problem solving that attempts to spark ideas and solutions through indirect reasoning. The method was first introduced by Dr. Edward de Bono in 1967. It incorporates a number of Thinking Tools.

Launch - The initial production, delivery, marketing, and sale of a new product or service. It represents the culmination of an extensive amount of research, design, development, and planning work.

Lean Canvas - An alternative variant to Alex Osterwalder's 2008 Business Model Canvas published by Ash Maurya in 2012. In this variant of the canvas, the business is asked to consider nine key attributes of the Business Model, namely Problem, Solution, Key Metrics, Unique Value Proposition (UVP), Cost Structure, Unfair Advantage, Channels, Customer Segments, and Revenue Streams. The canvas is laid out such that the first four of these plus the UVP relate to the Product the business is delivering, while the last four plus the UVP relate to the Market the business is addressing.

Lean Startup / Lean Startup Model - An approach to launching new business ventures in which Minimal Viable Products (MVPs) are used to create rapid in-market feedback and learning cycles. This allows the business can learn as quickly and as cost-effectively as possible about product-market fit and thereby evolve its offering as rapidly as absolutely possible in the proper direction. This results in a level of capital efficiency (and thus risk mitigation) that many investors like.

Left Brain Practices - The fourth mandate in the Experiential Human Innovation Framework. It is a principle which holds that businesses who are pursuing innovation must – in the course of their innovation work – minimize the push for “left-brain” practices like process optimization and process standardization, while maximizing the use of “left-brain” activities like market analytics that support intelligent innovation. The reason for this is that innovation work is work that, particularly on its Front End, is inherently inefficient (though highly effective), because it requires a significant amount of repetitive research and experimentation to figure out and get it right (consider the many hypothesis-testing loops and solution-testing loops associated with Design Thinking).

Level of Engagement - A reference to the level of intensiveness of each Mechanism of Engagement. Mechanisms are more or less intensive depending on how much time, effort, and focus they require of participants. Some require relatively little, while others require extensive amounts.

Listening Post - An office set up in a strategic location – typically a key urban center – and staffed with appropriately skilled researchers and analysts, for the purpose of actively monitoring relevant events and trends happening in those places. These allow a business to stay abreast of the happenings and trends that are pertinent to their efforts in the region. Localization of Innovation – See Loci of Innovation

Loci of Innovation (Localization of Innovation) - The idea that, within a business organization, innovation can (and ideally should) originate from multiple different sources in the business (considering the three different horizons in the Innovation Strategy and the different types of innovation these give rise to), and the choice, therefore, of where within the organization to primarily locate the business' core innovation efforts. In general, businesses have three choices... either a) centralize all innovation into a single core group, b) decentralize all innovation, integrating it into the business units and functional groups, or c) take a hybrid approach in which certain types of innovation are centralized into a core group and other types are integrated into the business units and functional groups. Each choice has certain pros and cons.

M

M Discovery / Market Discovery - Focused discovery research work aimed at developing a fresh and renewed understanding of a particular market or market situation. Its purpose is to help build a new context for a particular situation. To the extent possible, each individual who is to be a party to

an Oblique Examination exercise should undertake their own Market Discovery work. This is so that they understand the insights it yields firsthand, and do not have to take them from secondhand sources. This makes the insights much more tangible and believable for the individual, which results in a far richer team exercise when the team moves into Oblique Examination.

Macro Innovation - Innovation taking place on a strategic scale within a business (regardless of its size or structure). From a scope and impact standpoint therefore, it is commensurate with Strategic Innovation and thus involves such matters as the business' defined Innovation Strategy, Strategic Innovation Portfolio, and Enterprise Innovation Program. Innovation at this level is concerned with how to make a given business increasingly more innovative with respect to its markets.

Management Innovation - The continual pursuit of fresh, new, and often innovative ways for leading, structuring, and managing business organizations that resonate afresh with how the world is now operating. These produce the sorts of attuned and agile organizations needed to measurably increase their connections with their markets and thus measurably alter their ability to respond intelligently, swiftly, and correctly to the signals – both strong and weak – these markets are sending. By fully abandoning the 20th Century Industrial Era constructs of Scientific Management Theory, these new ways create the highly-innovative organizations capable of leading their markets well into the future.

Market - A group of consumers (individuals or businesses) who secure and use a common value proposition from a set of providers to accomplish a common or similar outcome. While from a sales standpoint, providers may engage members of this group individually, from a marketing standpoint, providers will generally engage this group collectively. A market can be made up of any number of different market segments, each with its own characteristic demographic and psychographic profile, and thus needs and motivations. For this reason, providers must often tailor their marketing to the unique resonance points of a one or more particular segments.

Market Acuity - The skill of understanding how to study and interpret one's markets and their needs, both in their current states and in their expected futures states arising out of the changes they are undergoing due to the myriad forces at work in the world. Market Acuity is a necessary ingredient for being able to deliver breakthrough innovations that truly resonate with one's markets.

Market Research - Research into markets (aggregated users), both in their current states and in anticipated future states relative to emerging trends. In the context of innovation, its aim is often to understand the scale and scope of certain needs, desires, wants, and/ or proposed solutions – to find out if what has potentially resonated with a small group of users will in fact resonate across entire markets or market segments at scale, and if so, to what extent. It is also used to ascertain the nature and degree of satisfaction with existing offerings, experiences, and brands, including loyalty to those brands and the propensity to promote the brands to others.

Market Scouting - The focused and intentional search for new markets or market segments into which a business can extend its presence given its current technologies and offerings. It enables the business to pursue organic growth by leveraging its existing technology portfolios and R&D roadmaps beyond what it has done to date.

Market Segment - Within a given market, a subgroup of consumers (individuals or businesses) who share a common psychographic profile (needs and motivations) and thus a uniform and homogenous set of drivers for securing and using a particular value proposition. Given the uniformity of their needs and motivations, they will generally respond uniformly to certain attributes of the offering and to a particular brand message / brand promise. The attributes and message that resonate with one market segment are often unique to that segment and different

from those that resonate with another market segment, owing to each segment's unique needs and motivations.

Marketing Innovation - Innovation delivered in the form of new and novel commercialization (go-to-market) strategies, including new and novel sales channels, marketing channels, production channels, and/or distribution channels. It creates meaningful new connections between a business and its markets (including entirely new markets or segments, or new adjacent markets), allowing the business to bring value and/or experiences to a market that are meaningfully better than what that market previously had access to.

Maverick Panel - A Mechanism of Engagement in which a panel of outside "mavericks" are assembled and brought into the business so that the business' leaders can engage them in series of discussions and debates, typically around the future evolution of a particular market, or perhaps several markets. These "mavericks" are often individuals whose thinking lies on the periphery of the mainstream and thus stretch the envelope of thinking for that particular area. The business' leaders need not agree with them, only listen to them and give consideration to what they are saying and why they are saying it.

Mechanism of Engagement - A specific event or activity that Program Leaders use to drive engagement in the business' Enterprise Innovation Program. There are a large array of such events and activities for leaders to choose from. Leaders must select a portfolio of mechanisms best suited to their organization and to where it is in the course of its innovation program.

Mega Innovation - Innovation taking place on a global scale, generally involving nations, regions, societies, and occasionally the world as a whole. The concept is often used in a comparative context, examining how one nation, region, or society is more or less innovative than are other nations, regions, or societies. In other cases it is used in a historical context to compare how the world at large in one particular era is more or less innovative than is (or was) the world at large in a different era.

Megatrends - The overarching world trends which influence a particular market – both its current state and its future evolution. These can be any type of trend – societal, technological, economic, environmental, political, or legal, or any combination thereof.

Metric - Any measure used to ascertain a specific area of business performance.

Micro Innovation - Innovation taking place on a tactical scale within a business, thus involving the individual innovation projects the business is pursuing and the many innovation activities that take place within those projects. Innovation at this scale typically relates to such activities as Needfinding, Design Thinking, and Intellectual Property protection. In the vast majority of cases, whenever the topic of innovation is being addressed in the media and in academic literature, it is typically referring to innovation on this scale.

Mid Zone of Innovation (MZI) - In the conduct of innovation projects, that work which takes place around the middle of a project (following completion of the Front End). It can take place before or after kicking off the endeavor as a formal project, depending on the business' project approval and project governance preferences. This work typically involves the go-to-market strategizing around how best to define and position a solution in the market to maximize its market and business impact, including branding, design, attribute, and pricing considerations, as well as potential sales, marketing, production, and distribution channels. The Mid Zone of Innovation is colloquially known as Innovation's second mile.

Mid-Zoners - Those innovation workers whose work focuses primarily on the Mid Zone of Innovation in projects.

Milestone / Project Milestone - The point at which a project – being managed inside of a Phase-Gate project governance cycle – reaches the end of a particular phase. At such points, the project will typically face a Tollgate Review before it can proceed on to the next phase.

Milestone Review / Project Milestone Review - A Tollgate Review occurring at any one of a project's Milestones.

Minimum Viable Product (MVP) - A version of a new offering that possesses only the most adequate levels of functionality and performance as to be considered viable for its intended application in its intended target market. While its performance and functionality may only be adequate, it still nevertheless represents a unique value proposition (UVP) – relative to other options available on the market (or the absence of any options at all) – such that potential customers are willing to give it a try. MVPs are often the approach used by new business ventures when taking the Lean Startup approach.

Moderate Innovation - An innovation that – within the continuum between incremental and breakthrough innovation – is more than incremental, yet not quite breakthrough. It is somewhere in between. This is common, as there are a large number of innovations that end up being more extensive than an incremental innovation, but yet do not quite meet the criteria for a breakthrough. Anything near the center of this continuum is thus considered a moderate innovation. See Incremental Innovation. See Breakthrough Innovation.

Moment of Truth (MoT) - A Touchpoint within a customer experience where the customer has a particularly positive or negative emotional reaction to the Touchpoint. While positive and negative emotional reactions can be created at any Touchpoint, they are often muted at Touchpoints considered less important by customers (where their expectations are potentially lower). For this reason, MoTs most commonly occur at Touchpoints that customers consider particularly important and therefore have high expectations for.

Motivation - A fundamental driver that compels a customer to pursue a particular outcome (and the jobs it requires) in relation to a particular need they have. It can be influenced by the customer's psychographic profile and lifestyle characteristics, including their beliefs and values.

N

Need Map - An analysis of needs identified in a particular market according to the extent to which they are a) met or unmet, and b) articulated or unarticulated. This results in a 2x2 matrix whose four quadrants are designated as Red Ocean Commodities (articulated / met), Table Stakes (unarticulated / met), Attribute Enhancements (articulated / unmet), and Distinctive Value Opportunities (unarticulated / unmet).

Need Mapping - The act of constructing a Need Map.

Need Space - The areas a business looks at in search of finding new unmet / under-met / ill-met, and possibly unarticulated, needs that it can potentially meet. In accordance with the business' intended innovation strategy, it will typically choose very specific areas in which to make this search (those which strategically fit the business). Each new need identified represents an opportunity for the business to deliver new innovation into that space.

Needfinding - Focused investigative research undertaken by a business for the purpose of exploring any number of markets in search of unmet and/or ill-met needs – and potentially unarticulated needs – in those markets. If such needs have enough Scope to them such that a solution can deliver the level of Scale that is of interest to the business, and if they represent matches to the business' Innovation Strategy, then they are potential Innovation Opportunities the

business can consider. As the business finds these needs, it can undertake additional research on each one in order to further qualify them so that in the end it can select some portion of them to fill out its Strategic Innovation Portfolio in support of its overall Innovation Strategy.

Net Promoter Score (NPS) - A measure of customer loyalty, either to a brand or to a business. Determining a brand's NPS begins with surveying current customers to find out how likely they are (on a scale of 0 to 10) to recommend the brand to friends and relatives (other potential customers). These individual scores are then averaged to yield an overall Net Promoter Score.

New Business Venture - A business that is entirely new, and is being started from the ground up. It would have a set of Founders leading it, and would be pursuing some opportunity in a market based on a particular challenge it has identified, using a unique value proposition and business model it has defined. In the case of technology ventures (a substantial volume of new ventures now), these are typically regarded as "fast-growth" ventures, in that their operating cost structures are very low in relation to the level of revenue they are able to generate, making them capable of being scaled very quickly in a market.

New Product Development (NPD) - The managed set of activities associated with developing new products and services. Such products and services may be completely new ground-up offerings, or evolutions and extensions of existing offerings. There are well-established processes governing the proper management and execution of NPD work so that the resulting products and services will be commercially successful.

New to the Business Solution / Offering - An offering (representing a solution to a need or desire) that currently exists in the world, but which a given business has heretofore not offered for sale. Expanding into that market or segment therefore represents a potentially lucrative new source of revenue for the business.

New to the World Solution / Offering - An offering (representing a solution to a need or desire) that currently does not exist in the world. Though it can represent a substantial investment of time and resources, businesses can bring to life entirely new markets by defining, developing, marketing, and selling these – a potentially lucrative innovation strategy known as Market Creation. Being able to successfully bring these to the market requires a business to have a very firm grasp on either emerging (unmet) needs in a particular market space, or on latent needs in a market space that emerging new technologies can better address than do existing solutions.

O

Oblique Examination - A critical and analytical examination process in which a team – having previously established a basis via discovery research – examines a particular situation from a broad array of different (oblique) perspectives, in each case identifying the assumptions underlying the situation and then testing them for ongoing relevance and validity by purporting their opposites to be true. By forcing the team to look at the situation from many new, oblique points of view, and by forcing them to test the underlying assumptions of the situation, the process often opens the team up to the realization that the existing, entrenched ways of seeing the situation are no longer the most valid and relevant ways of seeing it; that there is instead a better and more relevant way of seeing it that opens their minds up to innovation new solutions for attacking the situation. Oblique Examination is the third step of the GInI Breakthrough Innovation Method.

Observation Room - A private room adjoining a User Research Lab via a 2-way mirror. In this room, researchers are able to sit and watch a User Research or Design Research experiment taking place, directly observing the behaviors (words and actions) of test subjects. Because the researchers are isolated behind a 2-way mirror, test subjects cannot see them; they remain covert and unseen.

Observe Methods - The first of four categories of Design Methods. These methods are designed to allow researchers to make observations of subjects from afar and infer new insights about them from their observations. With these methods, researchers watch and observe customers from afar without making any intrusion, allowing them to make keen, objective observations of customers' behaviors. This allows observation of true behaviors, but may not reveal the causalities for those behaviors.

Observing - The skill of being able to astutely and critically observe a situation – individual customers, whole markets, business stakeholders, or others – and derive useful and relevant insights from those observations. It is one of the five Innovation Discovery Skills documented in the book *The Innovator's DNA* by Dyer, Gregersen, and Christensen.

Offering - A specific product, service, or customer experience which a business markets and sells to its customers in exchange for revenue. Each such Offering is a tangible expression of a particular Solution the business offers in response to a specific market need.

Open Engagement - The tenth mandate in the Experiential Human Innovation Framework. It is a principle which holds that businesses must approach their workers from a mindset of freedom, openness, and mutual respect, as opposed to the highly constrictive one- job / one-skillset / one boss mentality of the Industrial Era. This radically transforms how the business engages these workers, allowing for substantially greater freedom and autonomy in their work, skill development, and career paths.

Open Innovation - The practice of pursuing new innovation – either the identification of new market opportunities, or the identification of new solutions to known problems – from sources outside the business rather than solely from inside the business. This contrasts with the traditional industrial mindset in which all of a business' new innovations had to emanate from its own dedicated R&D sources – the “not invented here”, or NIH, syndrome. With Open Innovation, the business' innovations can be sourced from anywhere – inside or outside the business.

Open Innovation Partnership (OI Partnership) - A partnership between two businesses – often curated, or brokered, through an online Open Innovation Portal – conceived in order that the primary business can incorporate the technology and know-how of the secondary business so as to attack a specific market opportunity it has identified. Given that the secondary business can bring any manner of know-how to the relationship – both commercial and technical – OI Partnerships can be leveraged to help a business pursue both Value Capture and Value Creation efforts. OI Partnerships are a form of Partnership – Strategic Innovation Vehicle 2.

Open Innovation Portal - An online brokerage / match-making portal for Open Innovation partnerships. These portals work in the following way. A business looking for new solutions to its challenge posts that challenge onto the site.

Opportunity - A situation in which a business has identified a clear need, problem, or challenge in a market to which it can deliver an innovative new solution that is measurably better than anything currently in that market and which will therefore give it a clear competitive advantage in the market. Each such situation must carry with it a certain scope so that, with appropriate marketing, the solution can scale in the market and achieve a certain level of adoption that, given a particular pricing strategy and cost structure, will result in a desired level of revenue and profit and thus return on the investment.

Outcome - The ultimate result a customer desires (and expects) from having used a product or received a service to undertake a series of jobs. Outcomes are often classified as functional, emotional, or social.

Outcome-Driven Innovation (ODI) - A focused innovation methodology for identifying the key usage parameters (jobs, outcomes, and barriers) of an existing offering and, for each relevant segment of the market, analyzing those parameters through user surveys in order to establish which are deemed most important and least satisfied for that segment. This allows a business to synthesize incremental innovations, and sometimes breakthrough innovations, that deliver noticeably better usage performance within the affected category. To undertake this process, the business would first engage in primary customer research to gather user-experience insights relating to the outcomes customers need, the jobs that have to be done in order to achieve those outcomes, and the constraints customers currently encounter in the course of pursuing those jobs and outcomes.

Outcomes / Innovation Outcomes - The actual results of individual innovation projects, in terms of the extent to which each project does or does not achieve its targeted success criteria. These are often compared across entire portfolios of projects to understand how the business is performing with its innovation program and where the business needs to focus its improvement efforts.

Output - The number, or ratio (relative to Conversion), of Outputs occurring within a particular time period. Many organizations track their number (and caliber) of Outputs for each period and have KPIs for the level and pace of Output the business wishes to see. Since some projects will have inherently been culled at different stages of the Pipeline, the level of Output will always be less than the level of Conversion (a ratio less than 1).

Outputs / Innovation Outputs - The innovation projects that get fully implemented or commercialized coming out of a business' Innovation Pipeline. This infers that the project successfully passed all of its Milestone Reviews in the Pipeline, with their respective go/no-go/pivot decisions, including any Pilot steps involved, and is now well into the process of being fully scaled.

P

Packaging Innovation - Innovation delivered in the form of compelling new product packaging that communicates a certain compelling brand message to consumers. Such package designs are new and novel in some important manner and create the expectation of meaningful new value and/or experiences to the users of the enclosed products.

Paper Prototype - A fast, simple prototype using basic 2D items like paper, markers, Post-it™ Notes, and other similar materials. Here, a group will add, subtract, and move things around on paper in order to collaboratively explore a concept or question together. By sketching out the relevant concepts, they can organize their collective thoughts, articulate ideas and concepts, visualize abstract concepts, and brainstorm new insights. Because this approach is so straightforward, it allows a group to explore numerous concepts and issues together in a fast, easy, cost-effective, and zero risk manner. As such, it is often the starting point teams use to launch into the rest of their work.

Participatory Innovation - An approach to Innovation Strategy – also known as Bottom-Up Innovation – in which new innovation efforts are derived directly from opportunities identified by the business' workforce (bottom-up). It is so named because it is based on the worker participation associated with Engagement in the business' Enterprise Innovation Program. See also Engagement.

Patent - A form of Intellectual Property protecting either the claims of a physical or graphical design (Design Patent) or the claims of the technical knowledge associated with an invention and its practical application (Utility Patent).

Performance Testing - Testing of existing or prototype products or services to ascertain their functional performance behaviors for each of their intended functions. These can be used to establish performance baselines, compare the performance of competing brands and models, develop best practice guidelines for optimal performance, and drive performance improvements.

Persona / Customer Persona - A characteristic aggregate profile of a fictional customer, usually given a characteristic fictional name, used to represent a particular market segment by giving it a characteristic face and description. The key distinguishing features of this persona may be demographic, psychographic, lifestyle, affiliation, outcomes, or otherwise in nature, depending on how the business wishes to draw the lines between the market's unique segments.

Personality Type - The concept that different individuals each have a particular personality profile, primarily on account of how they are wired physiologically, with some influence from their early childhood experiences. According to leading personality type models, personalities can be profiled according to their particular mix of key dispositions. In the well-known DiSC model for example, these dispositions are known as Dominance, Influence, Conscientiousness, and Steadiness, and each person will have some characteristic mix of these four dispositions.

Phase-Gate Process – for Project Management / Project Governance - An approach to project governance in which projects are executed in phases, and then at certain points in the process (Tollgates), are subjected to Tollgate Reviews. By managing innovation projects in this manner, businesses can maximize their investment in innovation while simultaneously minimizing their exposure to risk. They do so by converting a large number of opportunities at the start of the Pipeline and then through thorough research and evaluation of each opportunity, select only the most promising ones for ultimate implementation, killing off the ones found to not meet their criteria.

Pilot - The act of piloting new innovations in the business' Innovation Proving Ground stage. Piloting refers to conducting pilot projects of the innovation in test markets so as to learn whether or not assumptions about acceptance and adoption are correct and whether or not a full-scale investment is therefore warranted.

Pipeline Owner - The Innovation Program Leader(s) assigned to “owning” (overseeing) a business' Innovation Pipeline. Their job is to ensure the Pipeline is being properly governed and executed. As such, they require operational authority in the business to enforce proper discipline in the Pipeline, and they must have no reservations about exercising that authority so as to prevent competing interests from abusing the Innovation Management process.

Pitch - A presentation made by a team – intended to be persuasive and compelling – presenting a particular innovation opportunity to certain stakeholders in the business – often those who must decide whether or not to sponsor and fund the project. To make this presentation engaging and compelling to their audience, the team must be able to tell a story that unfolds the opportunity, revealing it through a logically-organized sequence of story elements. Variations of the pitch should be developed telling the story in differing timespans – 1, 2, 5, 10, 15, 20, and 30 minute versions not being uncommon.

Pitch Deck - A digital presentation file used by a team when presenting their pitch. It is intended to be a visual aid to help them tell their story. As such, it has to be lean and well-designed, able to convey each concept at a glance, and only containing a handful of slides supporting the major points being made. Any more than this and it becomes a distraction rather than a support to the story, drawing attention away from the storytellers where it belongs. Pitch Decks must therefore be thoughtfully designed.

Point of View - A formalized statement of a properly reframed problem, need, or challenge. It is the outcome of having worked through the Problem Clarity stage of the Design Thinking process, in which a team has formulated and tested a set of hypotheses about the true customer needs involved, so that they could converge on the most correct hypothesis. It is the isolation of this correct hypothesis that then allows the team to be able to state their Point of View about the situation. This Point of View thereafter enables the business to deliver an innovative solution that properly addresses the real customer needs at work.

Portfolio Approach - An approach to selecting the Mechanisms of Engagement a business will use in its Enterprise Innovation Program that should result in optimal overall engagement. In this approach, Program Leaders undertake three critical considerations. First, they consider the state of the organization and where it is with its innovation program – is it relatively young and immature, or well-seasoned and highly mature with respect to innovation.

Problem Clarity - The first major stage of the Design Thinking process. It entails Hypothesis Forming, Business Experimentation, and Hypothesis Testing. Its aim is to conceive and test a large array of hypotheses about a particular problem, and thereby converge on a single best hypothesis.

Problem Reframing - The practice of taking a problem, need, or challenge that in its beginning has been framed in the language of Surface Symptoms, which are often expressed as functions, features, capabilities, and so forth, and then reframing that problem, need, or challenge into a new mindset focused on the outcomes that are needed, which are often expressed in the language of needs, desires, and motivations, and sometimes even values and beliefs. This is done so that new solutions can be conceived and designed that solve for the real outcomes needed, and not (erroneously) for the Surface Symptoms originally presented. The process by which problems can be reframed is one of postulating and then testing multiple hypotheses about the needed outcomes so as to arrive at a correct hypothesis of those outcomes.

Problem Space - The areas of considerations around a particular problem that has been identified and chosen for examination. It may include evolving market trends, customer needs and motivations, customer values, beliefs, and priorities, attributes of current offerings, the nature of prevailing business models, and so forth. In order to properly understand a problem, and the more fundamental expression of it that comes from reframing it, a business must explore deeply through these considerations, including potentially conducting experimentation in these areas so as to test certain hypotheses about them.

Product Design - The detailed attributes of a product's design.

Product Experience - A customer experience explicitly associated with considering, researching, purchasing, receiving, preparing, using, and retiring / replacing a product. The most critical phase of this experience will be in actually using the product for its intended purposes – does it meet or exceed the customer's expectations for each job it must do and for the outcomes it produces? A positive, innovation product experience will ensure that such is the case.

Product Innovation - New innovation delivered in the form of a product. It includes tangible, discrete products like automobiles and mobile phones (hardware), virtual products like mobile apps (software), and less tangible products like financial and insurance offerings. As an innovation, it is distinguishably different from, and better than, all other products seeking to deliver the same outcome, making it highly compelling to its markets. Product Innovation arises out of delivering a product which has a very specific set of attributes that allow it to deliver better value and/or experiences than other products.

Product Lifecycle Management Software (PLM) - Purpose-built software designed specifically to allow a business to manage all the information relating to its offerings throughout their entire

lifecycles – from initial conception, to design, to production, to retirement. Most platforms in this category employ controlled vaults with controlled access rights and full document management capabilities (including versioning, revisioning, archiving, check-in/check-out controls, and so forth). Using this software, businesses can manage the production, collection, and flow of all pertinent documentation from start to finish, understanding all historical revisions the product has received and what drove those.

Product Roadmap - A forward-looking document that details the planned chronological evolution of a particular product line. It will capture, for each period of time, what new features, functions, capabilities, or design changes the product is intended to receive. Product Roadmaps can realistically only go so far out – generally five to seven years depending on the category – as beyond those points neither the underlying technologies or the market’s desires will be known with any reliability.

Product Roadmapping - The act of creating and/or revising a Product Roadmap.

Program Leadership (Program Management) - The functional roles involved in leading and managing a business’ Enterprise Innovation Program. This typically encompasses the Chief Innovation Officer, select Innovation Program Leaders who report to the Chief Innovation Officer, and other roles such as Project Initiation Champions. In many cases, these individuals are all a part of the business’ Core Innovation Group. Program Management – See Program Leadership

Project Initiation Champion - A well-respected and typically mid to senior level leader in the business whose role – as part of the business’ Core Innovation Group – is to help ensure new innovation projects just entering the Pipeline get a solid start in the Pipeline. This may entail selecting the Project Leader, helping to assemble the Innovation Team that will execute it, ensuring funds are earmarked and released accordingly, and helping this team plan out its initial plan of action, which will often entail research and analysis aimed at justifying the opportunity via a formal business plan. They will also typically help this team get the project through at least the first Phase-Gate Milestone in the Pipeline (and possibly others), so that it is well on its way to becoming a legitimate innovation project.

Project Initiation Process - The processes a business uses for kicking off new innovation projects. These projects – having been subjected to a certain amount of scrutiny and Due Diligence – have been chosen to become real innovation projects in the business (Conversion). Thus they pass from the business’ Innovation Funnel (evaluation & selection) into its Innovation Pipeline (project initiation).

Project Portfolio Management Software / Portfolio Management Software (PPM) - Purpose-built software designed specifically to allow a business to manage its Innovation Pipeline. Most platforms in this category allow managers to assign projects to different portfolios, then assign team members and other resources to each project, and finally track the status and progression of each project as it moves through the Pipeline’s phase-gate sequence, including what steps have and have not been completed and whether or not approval has been granted at each milestone. Some platforms also allow managers to balance and manage resources across the overall portfolio, but this typically comes at the price of having to “feed” information into the software almost daily, which can become overly burdensome to managers.

Prototype - An emulation of a physical or virtual artifact. Such artifacts might include, for example, a new web interface, a new product design, or the furnishings associated with a particular customer environment. Prototypes are used in a variety of ways, and for a variety of purposes, as surrogates for the real artifacts they represent, which ultimately would be produced in a more proper, high-volume manner if employed in an actual business application.

Prototype Fidelity / Resolution - A reference to the level of fidelity or resolution a particular prototype has. For early-stage exploratory work, most prototypes can afford to have low fidelity, as distinctions at that point are generally coarse in nature. For late-stage solution-convergence work, most prototypes will need to have high fidelity in order to be capable of revealing the level of detailed nuance researchers need at this stage.

Prototype With A Purpose (OFAT Testing) - A prototyping and testing philosophy which tasks researchers with focusing on a single variable or issue at a time – an approach also known as “one factor at a time”, or OFAT, testing. The reason for this is two-fold. First, it helps them to clarify what sort of prototype they need. Second, it helps them to manage the overall solution development / exploration / convergence process by breaking down the larger problem into a series of smaller sub-problems that are more easily tested. This avoids the potential of confounding their insights and delivers good clarity on their findings.

Prototyping - The act of building a prototype or mock-up. For most types of prototypes, the means for doing this typically involve low- volume, labor-intensive fabrication methods – very different from the high-volume methods used to produce the real artifacts they represent.

Provocateur - One who provokes businesses and others by challenging the status quo.

Psychographics - The ninth element in a Winning Business Plan. It profiles the targeted customer from a psychographic standpoint – items like lifestyle, hobbies, belief systems, recreational interests, and so forth. Only those aspects of the customer’s psychographics that are pertinent to the Tension and Relief should be included. If none are pertinent, this element should be omitted.

Q

Qualitative Market Research (Qual Studies) - Market Research that seeks to understand the qualitative nature of a particular market situation. It is often used to capture the “voice of the customer” or “voice of the market” in an effort to understand the qualitative nature of current unsatisfied needs, emerging needs and desires, changing usage patterns, and so forth. It is also used to help inform and guide ensuing Quantitative Market Research – research used to quantify the qualitative insights developed through Qualitative Market Research. Qualitative Market Research has extensive overlap with User Research Methods and Design Methods such as Contextual Inquiry and Customer Co-Creation for example.

Quantitative Market Research (Quant Studies) - It is often used to quantify (size) the scope of specific insights uncovered through Qualitative Market Research. Modern Quantitative Market Research relies heavily on online surveys and similar tools. These surveys are conducted with Panels of respondents who have volunteered to participate in such studies, but are otherwise filtered according to key demographic and/or psychographic profiles.

Question Methods - The second of four categories of Design Methods. These methods are designed to allow researchers to directly question subjects about their situations and experiences and thereby develop deeper insights about the subjects. With these methods, researchers engage directly with customers to gain immediate access to their thoughts, attitudes, and opinions, all of which are informed by their past experiences and current needs (meaning they have a contextual basis). Because these methods reveal customers’ motivations, they may explain the causalities associated with certain behaviors.

Question Storming - A generative team thinking exercise in which a team, working together, strives to craft extremely useful questions to ask. It is often used to craft the questions the team will need to employ when conducting field research, either observing a situation or engaging directly with

test subjects. The questions are intended to allow the team to drill deeper down into a certain situation so that ultimately they can come to understand it better.

Questioning - The skill of being able to ask astute and critically probing questions about a situation – individual customers, whole markets, business stakeholders, or others – and derive useful and relevant insights from the answers obtained. It is one of the five Innovation Discovery Skills documented in the book *The Innovator's DNA* by Dyer, Gregersen, and Christensen. Quick & Dirty Prototype – See Frugal Prototype R

R

Radical Innovation - An innovation that is either breakthrough or disruptive in nature.

Real Problem - The “real problem” a team will confront and address after having correctly reframed it away from its original Surface Symptoms and into a correct expression of the market's needs, desires, and motivations, whether those be emotional, social, or functional in nature (or any combination thereof). It is only by understanding this “real problem” that a team is then able to synthesize a new solution capable of solving for it. If they had attempted to solve for it at the level of Surface Symptoms, they would have missed the real need and thus failed.

Realization - The sixth and final step in the GInI Breakthrough Innovation Method. In this step, for each concept (value model) selected at the end of the preceding step, the business will invest additional time and effort into defining brand, product, and design strategies at a deeper level. To do this, appropriate staff are assigned to undertaking additional work on the concept, including more carefully constructed and scrutinized analyses.

Recognition & Rewards - The seventeenth element of an effective Enterprise Innovation Program. It defines how the business uses Incentives, Recognition, and Rewards in its innovation program. This includes the details of how it will incent, recognize, and reward both individuals and teams, both inside and outside the business, and the extent to which it will focus on Front-Enders, Mid-Zoners, and Back-Enders. Businesses must carefully consider and think through these details if they are to succeed at reinforcing the “value of innovation” message they need to send to sustain engagement in their programs over the long run.

Reinvention - The act of redefining and remaking a business by accordingly redefining its business models and offerings so that what it is doing and how it is doing it remain resilient to major structural changes happening in the world around it and within its markets. This sometimes involves a complete abandonment of what the business has done in the past and the embrace of an entirely different future direction. Among startup ventures, this is often called a “pivot”. Among established businesses, this is sometimes called a “refocus” or “transformation”.

Renaissance Person - One who possesses skills and insights in a multitude of complimentary areas – some hard like science and others soft like art – and who is capable of converting those skills and insights into real business ventures that they hardly capitalize upon.

Research - The collection and study of information relevant to a situation of concern, such as a customer need or market event. It may also include the generation of that information if it is not preexisting

Resource - Any asset a business can gain access to and thereafter leverage for the delivery of new innovations in its markets.

Reward - A consideration awarded to individuals and teams whose contributions in the business' Enterprise Innovation Program have produced positive impacts on the business. This usually requires that their efforts have resulted in identifying useful new innovations the business can

capitalize upon and/or has already capitalized upon. Rewards can be – and in most cases should be – commensurate with the level of impact these innovations have (or are expected to have) on the business.

Right Brain Practices - The fifth mandate in the Experiential Human Innovation Framework. It is a principle which holds that businesses who are pursuing innovation must – in the course of their innovation work – maximize their use of “right-brain” practices, particularly the practices of observing, questioning, empathy, imagination, creativity, analogy, and associativity. All of these tap into the powerful “dot-connecting” abilities of the human mind, as well as into each person’s particular base of experience.

Risk - The potential for negative outcomes occurring as a result of certain decisions being made (or not made) and actions undertaken (or not undertaken) by the business. This exists as a consequence of businesses’ inability (being made up of humans) to know the future with any degree of certainty. Because of this inherent future uncertainty in all human endeavors (including business), business’ must operate on the basis of limited information informed by past realities and current trends. Businesses therefore seek to undertake actions which will minimize this potential and conversely maximize the chances for positive outcomes.

Risk Management - The practice of undertaking specific actions aimed at minimizing a business’ level of exposure to risk. It must balance the short-term potential consequences of making faulty future investment decisions with the long-term potential consequences of not making any future investment decisions (usually a much greater risk than the short-term risks). The practice typically involves an extensive amount of analysis to evaluate the trade-offs associated with many different actions in a hunt for the one best set of actions that will produce the greatest future return without introducing the opportunity for significantly compromising the health of the business in the process.

Roles & Responsibilities - The eighth element of an effective Enterprise Innovation Program. It defines the specific roles and responsibilities the business uses to carry out its program. Depending on the business and its needs, it can select whatever array of roles and responsibilities it feels will most effectively execute its program, but either way it must ultimately define and fill these roles.

Route 1 / Route 2 / Route 3 - The decision of where a new product or service innovation will be developed. Route 1 infers that it will be developed entirely with internal resources – one of the business’ own internal R&D or NPD groups. Route 3 infers that it will be developed entirely with external resources – an outside design and development firm. Route 2 infers a joint effort in which the development will be executed collaboratively between the two parties. The important consideration is for the business to have effective resource management processes in place, so that it can quickly and easily assign one of these routes to a project, ensuring the project does not experience delays due to a lack of support.

S

Scale / Solution Scale - The size – forecasted or actual – of a new market opportunity associated with delivering a particular solution to a particular need in that market. This will be a function of the Scope of the need itself, and of the Positioning, Pricing, and Marketing strategies it chooses to use with the solution. Given that new solutions generally require time for adoption to occur, such opportunities will typically encounter small Scale at first, eventually growing at a steady rate, and then eventually tapering off as they mature.

SCAMPER Method (SCAMPER) - A generative group thinking exercise in which a team, working together, strives to conceive novel new means of recombining and reapplying ordinary things – often discarded or leftover things – in completely new ways that define new forms of value. The SCAMPER Acronym stands for: Substitute / Combine / Adapt / Minimize, maximize / Put to other uses / Elaborate, eliminate / Reverse, rearrange. In this method, a team is challenged to consider any number of things that alone are typically considered to be of little or no value – commodities, leftovers, and/or discarded items – and then contemplate all the different ways in which they might take those items and recombine their attributes in ways that yield totally new forms of value – substitute them for something else, combine them with something else, adapt them to some other purpose, minimize or maximize aspects of them, elaborate upon or eliminate aspects of them, reuse them elsewhere, rearrange them or turn them around, and so on.

Scope (Problem Scope) - The extent of a particular need in a market, in terms of how many potential customers it impacts. Since the Scope of a need will cap the maximum possible Scale a solution to that need can achieve, the need must have an adequate level of Scope to be of interest to a business, both financially and strategically. Most businesses therefore will have thresholds for the Scope of a need in order for it to represent an opportunity that is worth pursuing for the business.

Secondary Research - Existing research and its findings as compiled by independent third parties. Such research is typically applied as the first wave of market insight preceding any Primary Research a business may undertake, and is otherwise used to augment the Primary Research a business undertakes in the course of qualifying and quantifying a particular innovation opportunity.

Selection Process - The series of mechanisms, processes, and activates a business uses – within its Innovation Funnel – to select specific ideas and opportunities for Conversion into real projects in the business' Innovation Pipeline. In many organizations, this is a dual- stage process, in which the first wave of selections are made by a Level 1 Team of Program Leaders and the second wave of selections (the ultimate selections) are made by a Level 2 Team of executive leaders. In this case, the set of ideas and opportunities being considered by the Level 2 Team are those that were previously selected by the Level 1 Team out of the entire population of ideas and opportunities submitted.

Service Experience - A customer experience explicitly associated with considering, researching, purchasing, preparing, receiving, and retiring / replacing a service. The most critical phase of this experience will be in actually receiving the service for its intended purposes – does it meet or exceed the customer's expectations for each job it must do and for the outcomes it produces? A positive, innovation service experience will ensure that such is the case.

Service Innovation - New innovation delivered in the form of a service. It can include services delivered manually by humans, automated services delivered by machines, or – quite often – a hybrid of these working together. As an innovation, it is distinguishably different from, and better than, all other services seeking to accomplish the same outcome. Service Innovation arises out of delivering a service which has a very specific set of attributes that allow it to deliver better value and/or experiences than other services.

Signals - Patterns that emerge from the focused study of information and observations around us, revealing useful insights. Focused study is required to discern these patterns out of the “noise” otherwise surrounding us. Signals are divided into two subsets... Strong Signals – patterns generally relating to a current state of affairs and which are readily observable. Weak Signals – patterns generally relating to an emerging state of affairs and which require extensive focused research to uncover.

Social Innovation - The act of doing something in a new or novel way that delivers more value and/or better experiences to the members of society in a way that has an overall positive impact on that society and its neighboring societies.

Social Media Listening - A form of Market Research that seeks to study and understand the trending sentiment around a particular brand or business based on the character and quantity of social media buzz it is generating at any given time.

Solution - A means of solving for a particular problem, need, or challenge in a market that allows a business to define and deliver specific tangible Offerings it can market and sell. By appropriately solving for this situation, it represents a foundation of value the market is willing to pay for.

Solution Ideation - The initial step in the Value Definition stage of Design Thinking. It involves brainstorming a large number of potential solutions that may be able to address a team's Point of View about a problem. It will result in an array of solution concepts which will subsequently be prototyped and tested. Each such concept must conform to the team's Design Principles. This is a divergent and creative process.

Solution Prototyping - The second step in the Value Definition stage of Design Thinking. It involves building prototypes and mock-ups of each proposed solution so that in the next step (Solution Testing) they can be tested in the search for the one ideal best solution.

Solution Space - The areas a business considers for conceiving, defining, developing, and ultimately delivering a solution to a particular problem, need, or opportunity that has been identified. It may include brand strategies, positioning and pricing strategies, design strategies and attributes, business models, commercialization strategies (sales, marketing, distribution), and numerous other considerations. The boundaries of this space set the bounds on what sort of solution a business will consider, and thus define constraints on the design of the resulting offering.

Solution Testing - The third step in the Value Definition stage of Design Thinking. It involves testing prototypes and mock-ups of proposed solutions in order to systematically eliminate the weaker ones and ultimately converge on a single ideal solution. It is often an iterative step, and may require numerous re-loops in order to ultimately isolate the one best solution. This is a convergent process.

Sponsorship & Leadership - The first element of an effective Enterprise Innovation Program. It is the imperative that sponsorship and ownership of the program begins with the business' executive leadership team. Specifically, the program's sponsorship should emanate from the business' CEO and Board of Directors, and its leadership must exist within the CEO's immediate circle, typically an Executive Vice President reporting to the CEO and given the role of Chief Innovation Officer.

Stakeholder - Any party – inside or outside the business – particularly those at the executive level, who must play some role or part in supporting and/or executing a given innovation initiative or project. Without the full support, involvement, and work of these stakeholders, the initiative runs the risk of failing.

Stakeholder Analysis - An analysis of all the stakeholders in a project. Its aim is to understand each stakeholder and their respective motivations. A Stakeholder Analysis produces a Stakeholder Map.

Stakeholder Map - A mapping of all of the stakeholders in a project reflecting each stakeholders' respective motivations. These are typically laid out in a manner reflecting the flow of activities and information in the project, both inside the business (internal stakeholders) and outside the

business (external stakeholders). This map results from conducting a Stakeholder Analysis. Startup – See New Business Venture

STEEPL Analysis (STEEPL) - An analysis of current trends classified according to the categories of Societal, Technological, Economic, Environmental, Political, and Legal. Classifications such as this make understanding and applying the resulting insights more straightforward. Alternative forms of this Acronym include PESTL, PEESTL, and other arrangements of the letters.

Stitch-Shaped Individual (Comb-Shaped Individual) - The same as a T-Shaped Individual, except that the individual possesses deep expertise in more than one domain, often two, three, or even four domains. This is often the product of their having pursued advanced education in multiple domains, or having held multiple types of roles over the course of their career (or both). These individuals make for some of the best innovation leaders, as they are capable of relating to so many different cross-functional roles in the business.

Storyboard - The product of storyboarding, involving the visual representation of a situation, its characters, and its procedural flow. These are most often captured on a large working poster or similar whiteboard, so that a small group can see and interact with them together.

Storyboarding - A visual prototyping method in which an individual (often trained as an Illustrator) captures the “story flow” of a particular situation. It is typically used to help facilitate group analysis and ideation discussions. By visually representing the situation, the parties involved, and its procedural flow of activities, members of the group are able to more fully understand the situation and the pertinent concepts associated with it. Storyboarding originated with movie production, in which the movie’s storyline would be storyboarded so that producers could hash out the story’s plot details.

Strategic Innovation - The pursuit of innovation at the strategic level of a business, having as its aim the accomplishment of key strategic objectives such as growth, brand-building, and so forth. It encompasses three areas – the Innovation Strategy (dictating the areas and content of the business’ short, medium, and long-term innovation portfolios), the Enterprise Innovation Program (driving long-term sustained innovation in the business), and Innovation Outputs (achieving specific outcomes that cumulatively accomplish the intended strategic objectives). The more Innovation Maturity a business has, the better is it able to pursue Strategic Innovation.

Strategic Innovation Portfolio - The portfolio of Strategic Innovation projects a business is pursuing. It can be expressed at a high level as the selection of Strategic Innovation Pathways the business is pursuing, and at a lower level as the collection of specific innovation projects the business is pursuing in support of that high-level definition. A business

Stress Test - A test of proposed, and often alternative, future business strategies against any number of potential future scenarios, as envisioned and documented in a Scenario Plan. Its aim is to identify those strategies that hold the greatest potential for being robust against the greatest number of different potential and/or likely future scenarios.

Study Methods - The fourth of four categories of Design Methods. These methods are designed to allow researchers to deeply investigate and study subjects and their situations so as to develop the deepest of insights about them and possibly explore new solutions with them to find out what will resonate. With these methods, researchers carry out evaluative tasks aimed at learning a situation better and creating a shared understanding of the situation.

Surface Symptom - A piece of evidence relating to a particular problem situation which in actuality exists only on the surface of the problem (not down inside the problem) and thus is simply a symptom of the problem, not the Real Problem itself. If one were to attempt to solve for the problem using only these pieces of evidence, they would fail to solve it in any way that is better

than current solutions do (which are inadequate, thus the situation remains). As such, one must go beyond these Surface Symptoms and get down inside of the problem in order to correctly understand its true nature – something that can be done by formulating and testing hypotheses about the problem so as to find its correct hypothesis.

Surprise and Delight - The idea that, in order to deliver a particularly memorable Brand Experience, a business must create the conditions at particular Touchpoints necessary to surprise the customer (by delivering value they did not expect) in a way that ultimately delights them (leaves them with a highly positive emotional response for that Touchpoint). Creating these conditions at just the right Touchpoints can create a particularly memorable and positive Brand Experience that serves to build the brand's overall value and keeps customers coming back to the brand time and again in the future.

Sustaining Innovation - An innovation that is intended to sustain the use and consumption of a particular offering by incorporating incremental, yet innovative, new attributes in the offering.

Synthesis & Capture - The fourth step in the GInI Breakthrough Innovation Method. It is an exercise in which a team attempts to conceptually synthesize new value models – new business models and/or new products or services – that will attack the identified value- deficit space in a new and different way. In the initial capture of these models, each main concept and as many supporting details as are known at the time are captured and documented, but full, hard details will not be developed.

T

T Discovery / Technology Discovery - Focused discovery research work aimed at developing a fresh and renewed understanding of the state of certain technologies and of new, emerging technologies. Its purpose is to help build a new context for a particular situation. To the extent possible, each individual who is to be a party to an Oblique Examination exercise should undertake their own Technology Discovery work. This is so that they understand the insights it yields firsthand, and do not have to take them from secondhand sources. This makes the insights much more tangible and believable for the individual, which results in a far richer team exercise when the team moves into Oblique Examination.

T-Shaped Individual - An individual who is both deep in a particular area of expertise and otherwise broadly knowledgeable and seasoned a variety of other areas. They are often highly experiential – having lived and worked in a number of places around the world, and having experienced numerous different adventures. They are characteristically associative thinkers... their minds are constantly striving to create new patterns out of their worlds. It is widely held that these individuals make for the best innovation workers, as they inherently possess many of the skills so necessary and valuable to innovation work.

Tactical Innovation - The work associated with executing individual innovation projects. It is highly cross-functional in nature, and includes all of the Front End, Mid Zone, and Back End tasks such as research, problem hypothesizing, business experimentation, problem clarification and reframing, design principle establishment, solution brainstorming, prototyping, solution selection, commercialization strategy development, and the many steps involved in defining, designing, developing, and implementing a final solution. It may involve the use of numerous Imagination, Creativity, and Innovation Methods.

Target Market - One of the six (6) Domains in a business' Business Model (the first Domain of Value Proposition in the BMI Framework). It relates to who the business intends to sell to. As such it addresses the question of which market(s) to go after – Existing Markets & Segments, Adjacent

Segments, Adjacent Markets, or the creation of entirely New Markets. Regardless of the answer, the innovation being delivered must resonate with that market. To deliver a solution, it must resonate with the market's needs, desires, and motivations. To further deliver a brand, it must also resonate with the market's beliefs, values, and priorities.

Task Facilitation - A principle associated with the design of Innovation Spaces which holds that such spaces must be designed to facilitate all of the tasks that will go on within them.

Team Profile - An additional element in a Winning Business Plan when a new business ventures is involved. It explains who the new ventures' key team members will be, what role each team member will fill, and what qualifications these individuals possess. It also lays out any key outside partners considered critical to the new venture.

Technology Audit - A survey and study of current and newly emerging technologies (or service methods) for consideration for use in a new product or service being planned. New technologies must be at points of maturity that match the product or service's intended development and launch schedule.

Technology Innovation - Innovation delivered in the form of meaningful new technologies (for products) and/or new methods (for services).

Technology Research - Focused research into understanding and applying new technologies for the development of new offerings. The research associated with traditional "R&D".

Technology Roadmap - A forward-looking document that details the planned chronological evolution of a particular technology. It will capture, for each period of time, what new functions and capabilities the technology is expected to produce. Technology Roadmaps can realistically only go so far out – the number of years depending largely on the area of technology – as beyond those points further evolutions cannot be predicted with reliability.

Technology Roadmapping - The act of creating and/or revising a Technology Roadmap.

Technology Scouting - The focused and intentional search for new technologies emanating from outside of a business for use in that business' current or future offerings. It enables the business to pursue organic growth that it otherwise could not, given its existing technology portfolios and R&D roadmaps.

The Analyst - An Innovator Profile – often from a financial or strategy discipline – in which the individual carries out detailed analyses of an innovation endeavor from a financial standpoint, including expected adoption models, sales models, cost models, profitability models, and cash flow models – analyses necessary to ensure high confidence in the financial return of the project. This profile is most predisposed to Mid Zone of Innovation work.

The Designer - An Innovator Profile in which the individual spearheads the design of an offering – its configuration, proportions, aesthetics, etc. This profile is most predisposed to Back End of Innovation work.

The Dreamer - An Innovator Profile in which the individual has an innate ability to conceptualize various ideal future states and articulate those to others. They may or may not have a vivid imagination, though that is often an asset. This profile is most predisposed to Front End of Innovation work and is often useful when attempting conceive new solutions.

The Engineer - An Innovator Profile in which the individual undertakes detailed development of an offering, using a variety of technical disciplines. This profile is most predisposed to Back End of Innovation work.

The Experimenter - An Innovator Profile in which the individual is constantly experimenting and trying out new things to see how they will work and, just as importantly, how they will be received by users. This individual will likely be a highly experiential person, and may also be very driven. This profile is most predisposed to Front End of Innovation work.

The Manager - An Innovator Profile in which the individual functions as a Product Manager, Project Manager, or both. They will champion the definition of an offering – its features, attributes, pricing, and so forth. This profile is most predisposed to Back End of Innovation work.

The Marketer - An Innovator Profile in which the individual coordinates all of the marketing and marketing communications work required to drive awareness of an offering and customer / market engagement with its brand. This profile is most predisposed to Back End of Innovation work.

The Maverick - An Innovator Profile in which the individual is generally dissatisfied with a current situation and is therefore constantly challenging the status quo. They have a natural hunger to be a part of creating the new, and often tend to be very driven. This profile is most predisposed to Front End of Innovation work.

The Producer - An Innovator Profile in which the individual spearheads production and delivery of an offering, getting all production / delivery logistics and all contributing parties lined up prior to the offering's launch. This profile is most predisposed to Back End of Innovation work.

The Questioner - An Innovator Profile in which the individual has a natural curiosity about the world and/or a particular situation. This drives them to step back and ask numerous probing questions about the situation and its underlying assumptions, often allowing them to uncover insights that others will have overlooked. This profile is most predisposed to Front End of Innovation work.

The Researcher - An Innovator Profile in which the individual has a propensity for researching all of the possible options for taking something to market. They may be adept as Business Model Innovation – exploring different possibilities and gathering the intelligence they need to support a good strategy. This profile is most predisposed to Mid Zone of Innovation work.

The Socializer - An Innovator Profile in which the individual has a propensity to network broadly, comparing observations, questions, and ideas with countless others having a wide variety of backgrounds. This is so as to find out how those observations, questions, and ideas square up against these people's diverse experiences and world views. This profile is most predisposed to Front End of Innovation work.

The Strategist - An Innovator Profile in which the individual has a propensity to drive toward defined strategies for taking new innovations to market, or otherwise implementing them. They often are able to synthesize new strategies that bring innovations to life in ways much better than has been done in the past. As such, they typically require broad latitude with the strategies they develop. This profile is most predisposed to Mid Zone of Innovation work.

The Supporter - An Innovator Profile in which the individual takes on numerous and varied tasks that fill in the gaps between other roles. This profile is most predisposed to Back End of Innovation work.

The Synthesizer - An Innovator Profile in which the individual is able to take the insights produced by other roles, together with a broadly- exposed world view, and synthesize something entirely new out of them, a skill known as associating, or colloquially “connecting the dots”. Many new business innovations have their origins in a Synthesizer putting together all the pieces to define something completely different from what has previously been offered and that is able to address customers' needs in a better way. This profile is most predisposed to Front End of Innovation work.

Three Time Horizons - A model that defines three horizons across a business' future timeline – Horizon 1, Horizon 2, and Horizon 3 – against which the business must plan for and execute new innovations and new business strategies intended to grow and prosper the business and ensure its resilience well into the future. This model was first introduced in 1999 in the book *The Alchemy of Growth* authored by Baghed, Coley, and White, and published by McKinsey & Company. See Horizon 1. See Horizon 2. See Horizon 3.

Tollgate - Any one of several gating points inside of a Phase-Gate project governance cycle. These often occur at the end of each phase of a project (its Milestones), but they may also occur at points in between Milestones. In most Innovation Management systems, Tollgates are designed to occur at a project's Milestones.

Tollgate Review (Project Tollgate Review) - An event involving the review and scrutiny of a project at a Tollgate of a Phase-Gate project governance cycle. This review is conducted by a Tollgate Review Team and has as its purpose the making of a go-/no-go/pivot decision on the project. Inside the Tollgate Review Meeting, the progress made to date on the project is carefully reviewed and scrutinized, and then based on certain pre-established criteria the business has for that phase, a go/no-go/pivot decision is made on whether to: a) continue working on the project as chartered, b) pivot the project by somehow adjusting its charter and scope, including possibly combining it with another project, or c) kill the project altogether.

Tollgate Review Meeting - The review meeting which occurs at each Tollgate of a Phase-Gate project governance cycle, in which the Tollgate Review Team carefully reviews and scrutinizes the project.

Tools / Innovation Tools - The specific tools that members of a business require in order to be able to carry out innovation work and successfully execute innovation projects within the context of the business' formal Enterprise Innovation Program.

Top-Down Innovation - An approach to Innovation Strategy in which new innovation efforts are dictated top-down from above by either an individual executive or a team of executives. This contrasts with Bottom-Up Innovation.

Touchpoint - Any point of interaction between a business and a customer or potential customer of that business, whether direct or indirect. These take place in the context of the customer experience that is occurring. With respect to the eight stages of the Customer Life Cycle, each stage may involve any number of unique Touchpoints, as required to successfully deliver that stage.

Trade Secret - A form of Intellectual Property in which select technical knowledge is maintained under strict secrecy so as to prevent others from using it, creating a unique brand identity and potential competitive advantage. Examples can include food and beverage recipes, manufacturing processes, mathematical algorithms, and so forth.

Trademark - A form of Intellectual Property protecting the representations of certain business assets, including the identities of businesses and/or brands. It can include names, logos, patterns, slogans, color combinations, sounds, and other such representations of the brand or business, all of which are used to uniquely identify that business or brand.

Transformative Innovation - An innovation involving such a radically new offering and experience that it entirely transforms society and how it operates. These often result from massive new capabilities. They often bring with them a major structural change in a market and in the relationships between society, governments, and other institutions. As well, they often create the need for new areas of government regulation.

Trend - The nature and speed in which a particular situation is changing. It can apply to any type of situation (political, legal, technological, societal, and so forth) as well as any type of entity impacted by those forces (markets, industries, businesses, and so forth). As such, trends can be watched, timed, scouted for, and even forecasted.

Trend Scouting - Conducting a focused search for specific trends that may be of relevance or importance to a business or a particular situation.

Trend Watching - The ongoing monitoring and study of current trends. It may involve trends occurring in any area of interest, such as particular markets, industries, regions, political situations, or other areas. In many cases, these trends are classified into discrete categorizations, such as Societal (including Sociocultural and Socioeconomic), Technological, Economic, Environmental, Political, and Legal, though other classifications are also possible.

TRIZ – The Theory of Inventive Problem Solving / TRIZ - An innovation method deriving from the classical invention process that takes a purely technological approach to new innovation. It recognizes that the vast majority of problems requiring an inventive solution typically involve a need to overcome a certain dilemma or trade-off (contradiction) between two or more contradictory elements. It subsequently applies a series of solution principles that lead to an optimally balanced solution.

U

U Discovery / User Discovery - Focused discovery research work aimed at developing a fresh and renewed understanding of users of a product or service. Its purpose is to help build a new context for a particular situation. To the extent possible, each individual who is to be a party to an Oblique Examination exercise should undertake their own User Discovery work. This is so that they understand the insights it yields firsthand, and do not have to take them from secondhand sources. This makes the insights much more tangible and believable for the individual, which results in a far richer team exercise when the team moves into Oblique Examination.

Urban Innovation - The act of doing something in a new or novel way that delivers more value and/or better experiences to the users (residents, commuting workers, etc.) of an urban zone in a way that has a positive overall impact on the urban zone and every other zone it touches.

Usability Testing - Testing of existing or surrogate prototype products or services with representative customers to ascertain the efficacy of their usage, including clarity of usage intent, ease of usage, pleasure of usage, and reinforcement of an intended brand message / brand promise through an appropriate Brand Experience. These can be used to establish usability baselines, compare the usability of competing brands and models, develop best practice guidelines for usability, and drive usability improvements.

Use Cases - Descriptions of the various ways in which a particular product or service is used by its end users. Depending on the simplicity or complexity of the product or service, and the different things it is capable of doing, there can be anywhere from one to hundreds of such use cases. When there are many use cases, Design Teams typically focus their work on only a small number of them at any given time.

User Experience (UX) Innovation - Innovation delivered in the form of compelling new user interfaces. Such user interfaces are new and novel in some important attribute and deliver meaningful new value and/or experiences to users.

User Needs Discovery - Focused investigative research into the use of a particular product or service category, aimed at uncovering users' current and/or emerging unmet, ill-met, and

potentially unarticulated needs. Up-front observations are taken deeper by engaging a sampling of users to develop a more complete understanding of the outcomes they desire and their specific motivations for such. Nuances can also be uncovered by exploring users' collective values, beliefs, and priorities. The research would also examine and consider the different situational contexts that influence these needs, desires, and motivations.

User Profiling / Market Segmentation - The act of studying a market's users with the aim of classifying its overall user population into a set of discrete segments, with each segment aligned along a particular set of criteria. These criteria establish the characteristic profile for each segment. The criteria used can segregate along any of several different lines... demographic, psychographic, lifestyle, affiliation, and so on. This choice, and the requirement for statistical significance, will thereafter determine how many unique segments arise out of the market. Once these distinct segments have been identified, they can be named and characteristic user profiles (personas) can be generated for each one.

User Research - Research into the users of a product or recipients of a service. The research is aimed at better understanding those users (also known as customers or consumers), their needs and desires around certain outcomes, and the activities they have to engage in order to accomplish those outcomes, as well as their underlying motivations for those needs and desires, including their values and priorities. The research can also capture situational contexts that influence these needs, desires, and motivations. Examples of User Research Methods include business ethnography, contextual inquiry, and focus groups.

User Research Lab - A purpose-built laboratory designed and used specifically for carrying out User Research and Design Research work. Such a laboratory would include a wide variety of elements. This can include, for example, open spaces for staging any manner of emulated customer environments (complete with real or simulated user artifacts), adjacent staging spaces for staging different props that will be moved into and out of the open space, an adjoining Observation Room for covertly observing user behaviors, cameras and recording equipment for recording experiments, and any manner of other props researchers find conducive to their experiments (for example, test instruments to aid in Usability Testing).

User Science Research - Studies of the actual performance of a product or service which seek to replicate real-world scenarios as closely as possible while still maintaining controlled environments so that careful A/B comparisons can be made. These are used to benchmark competing brands and models against one another, and to establish and/or verify marketing claims that are to be made so as to ensure truth in advertising.

User Story - A form of empathy statement in which the (characteristic) customer states... "As a (persona), I want to (action), so that (expected outcome)". This statement provides the business with some indication as to the customer's ultimately desired outcome needs, though the Persona part may or may not be relevant to that because it may not create an adequate level of context to help the business understand why the customer seeks that outcome. For this reason, a better version of the empathy statement may be the Job Story.

Utility Patent - A form of Intellectual Property protecting the claims of the technical knowledge associated with an invention and its practical application. V

V

Value Creation - An Innovation Strategy for delivering the Horizon 2 and Horizon 3 breakthrough, disruptive, and transformative innovations a business needs to continue reinventing its Foundations of Value (and itself) in the market so that it can remain resilient to the long-term

changes happening in the world. It entails a series of three (3) specific Pathways a business can pursue – Market Escalation, Market Expansion, and Market Creation.

Value Delivery - The second half of the Business Model in the BMI Framework. It addresses the two fundamental Anchor Points of Where and How, and encompasses the last three Domains of Potential – Value Creation, Value Capture, and Customer Acquisition. A portion of the first of these defines the business' approach to Value Conception, while its balance and the latter two domains define aspects of the intended Go-To-Market Strategy.

Value Equation - The ratio of the value derived from a solution (in terms of the outcomes it produces) to the combined price paid and effort exerted to access the solution. Increasing the value delivered improves the Value Equation. Increasing either the price paid or the level of effort exerted to secure it – in general – degrades the Value Equation.

Value Proposition - The first half of the Business Model in the BMI Framework. It addresses the two fundamental Anchor Points of Who and What, and encompasses the first three Domains of Potential – Offering Space, Brand Delivery, and Target Market. The first two of these define the unique foundation of value involved while the latter defines the markets and customers being targeted. There has to be clear resonance between these customers' needs and motivations and this foundation of value. As such, the Offering Space defines what it is the business is selling, while the Target Market defines who it is they are selling to, and Brand Delivery happens between these.

Value Proposition Canvas - A complimentary canvas to the Business Model Canvas that allows a business to study at a deeper level of detail the impact of new solutions on the customer and on the business. On its left-hand side it examines the Value Proposition, breaking this into Products and Services, Gain Creators, and Pain Relievers. On its right-hand side it examines the Customer Segment, breaking this into Customer Jobs, Pains, and Gains.

VUCA - An Acronym for “Volatility, Uncertainty, Complexity, and Ambiguity”. Originated with the United States Military. W

W

Wicked Problem - A problem in which not only is the solution unknown, but the actual, real problem is unknown as well. All that is known are Surface Symptoms of the problem. That being the case, the first step in being able to address a Wicked Problem is to properly and correctly frame the problem.

Winning Business Plan - A specific format for Business Plans which, by using a logically-organized sequence of story elements, unfolds and reveals a clear story about a particular opportunity in a way that is easy to understand and comprehend, and thus sets the foundation for being engaging, compelling, and persuasive – capable of grabbing decision-makers' and investors' attention and moving them toward action. This sequence of elements contains 28 specific points that must be made (30 if the proposal is for launching a new business venture). Additionally, businesses sometimes have specific items they wish to see included in Business Plans that are in addition to these points, and so teams will have to work to incorporate those items as well.

Winning Pitch Deck - A specific format for Pitch Decks which, by using a logically-organized sequence of story elements, helps a team to unfold and reveal a clear story about their opportunity in a way that is easy for audiences to understand and comprehend. It thus offers a foundation for enabling the team to tell an engaging, compelling, and persuasive story about the opportunity – one that is hopefully capable of grabbing decision-makers' and investors' attention and moving them toward action. This sequence of elements for the most part mirrors the 28 points used in the Winning Business Plan, albeit in a very compressed manner.

Wizard of Oz Prototype - A prototype in which certain functionality that is normally automated is instead emulated by humans operating it from behind the scenes. These are often used for early Usability Testing on things like web sites, user interfaces for discrete products, and so forth.

Workplace Innovation - The continual pursuit of fresh, new, and often innovative ways for operating a business' workplace and engaging its workforce that resonate afresh with how the world now operates. These produce highly capable, skilled, and – most importantly – engaged workers who fully embrace and own the business' mission and vision, and through mutual accountability, deliver significant impact to the business. By fully abandoning the 20th Century Industrial Era constructs of Scientific Management Theory, these new ways unleash a business' workforce to become the sorts of innovative organizations capable of leading their markets well into the future. “Works Like” Prototype – See Functional Prototype

WOW - A Moment of Truth that creates a particularly positive emotional response with customers. These typically result from exceeding customers' expectations at Touchpoints they consider to be particularly important, and where, therefore, their expectations are high. X
